

## EUNIS habitats

The EUNIS habitat classification is a comprehensive pan-European system to facilitate the harmonised description and collection of data across Europe through the use of criteria for habitat identification. It is hierarchical and covers all types of habitat from natural to artificial, from terrestrial to freshwater and marine.

An extensive review of the EUNIS habitat classification was initiated in 2012 based on European vegetation plot data. The revised groups of the classification are coastal habitats, grasslands, heathland, forest and other wooded land, sparsely vegetated and vegetated man-made habitats. The review concerns codes, scientific names and descriptions. A new element of the revised classification is that indicator species are identified for level 3 habitat types. The revision of the groups were concluded after a consultation with EIONET and vegetation experts. The review is on-going and more groups will become available.

The data coverage is Europe to Ural including Caucasus for the vegetation plot data.

The predicted distribution of habitat suitability cover the EEA38 and the United Kingdom.

## Conformance result

<b>Date (Publication)</b>	2010-12-08
<b>Explanation</b>	See the referenced specification

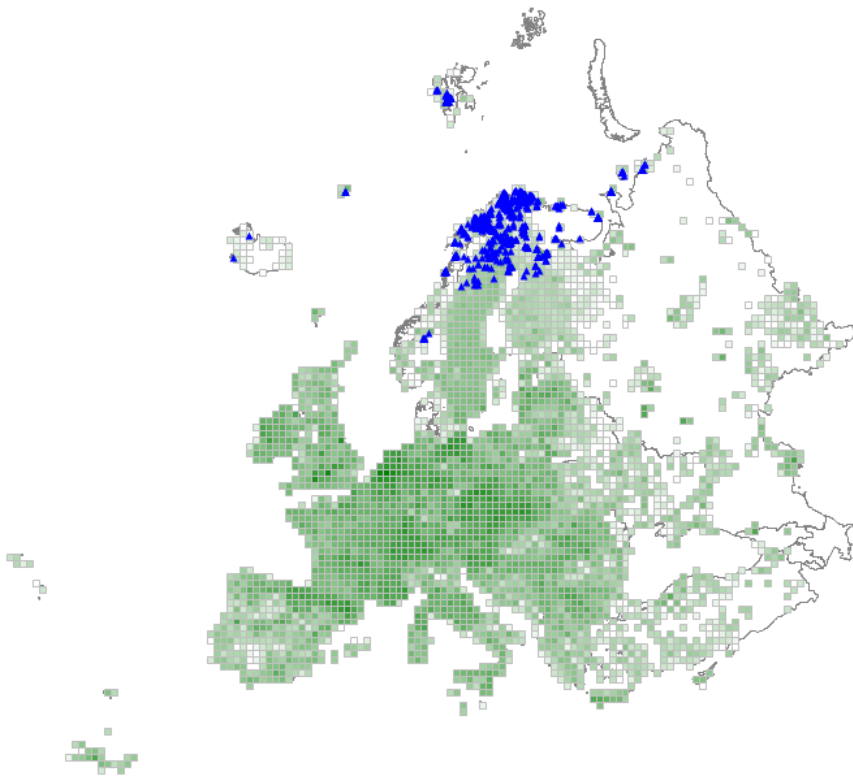

<b>Statement</b>	The database compiled for the Braun-Blanquet project comprises various national and regional vegetation databases. The maintenance of these databases is in principle in the hands of the custodians. However, before uploading datasets into the Braun-Blanquet database a quality check is performed by Alterra and Masaryk University. If possible, detected errors are corrected and reported back to the data provider. Attributes added to the distribution data are: YEAR (year of recording) and PRECISION (precision in meters, indicating how precise the location is indicated).
