

European Ground Motion Service: Ortho product, East-West Component between 2015 and 2020, Jul. 2022

The European Ground Motion Service (EGMS) is a component of the Copernicus Land Monitoring Service. EGMS provides consistent, regular, standardised, harmonised and reliable information regarding natural and anthropogenic ground motion phenomena over the Copernicus Participating States and across national borders, with millimetre accuracy. This set of metadata describes the third product level of EGMS: Ortho.

This EGMS Ortho product exploits the information provided by ascending and descending orbits of the Calibrated product (https://sdi.eea.europa.eu/catalogue/srv/eng/catalog_search#/metadata/dbc229ee-b94e-44e1-b0db-9bc57076bef1) to derive two further layers; one of purely vertical displacements, the other of purely east-west displacements (the one described by this metadata). Both layers are resampled to a 100 m grid. The Ortho product eases the interpretation process of non-experts since the viewing geometry has not to be considered anymore.

EGMS Ortho is visualised as a vector map of measurement points colour-coded by average velocity (vertical or east-west components) and distributed to users in comma-separated values format. Each point is associated with a time series of displacement, i.e. a plot with values of displacement per acquisition of the satellite. The product covers the Copernicus Participating States and United Kingdom.

Explanation	See the referenced specification		
Statement	The Ortho product is based on the decomposition of the Calibrated product to provide two discrete geospatial layers containing purely vertical and purely east-west (the one described in this metadata) displacements resampled to a 100 m grid. In summary, the process		

involves the following tasks: i) identify all the cells with at least one measurement point per orbit, ii) average the time series per orbit, iii) interpolate ascending and descending time series to a common six-day sampling and iv) estimate the vertical and east-west components following equations weighted on the estimated accuracy of the input measurements.
