

Agricultural area 2018 based on Copernicus data - version 1, Sept. 2022

This metadata refers to the dataset providing spatial information for "agricultural area" in 2018 with 1 ha spatial resolution across the EEA38 member countries and the United Kingdom. The methodological procedure to identify the agricultural area is based on the Corine Land Cover (CLC) pan-European Copernicus product as basic geographical skeleton that is spatially refined with Copernicus High Resolution Layers (HRL), local components and some manual corrections.

This spatial layer aims to be a spatial reference of agricultural area for the indicator on woody landscape features within agricultural areas in Europe. The layer can support indicator developments for monitoring the target of 10% of agricultural land covered by high-diversity landscape features under the EU Biodiversity Strategy for 2030 and for assessing the impact of the Common Agricultural Policy related to the strategic objective of protecting biodiversity, enhancing ecosystem services and preserve habitats and landscapes.

Title	Commission Regulation (EU) No 1089/2010 of 23 November 2010 implementing Directive 2007/2/EC of the European Parliament and of the Council as regards interoperability of spatial data sets and services
Date (Publication)	2010-12-08
Explanation	See the referenced specification
Statement	<p>This dataset provides spatial information for "agricultural area" in 2018 with 1 ha spatial resolution across the EEA38 member countries and the United Kingdom. The raster value is 1 when agricultural area is identified and NoData for other land cover / land uses.</p> <p>The spatial (GIS compatible) layer (referred to as Agricultural Area (AA) mask) was developed along the following lines:</p> <p>1) The use of Corine Land Cover as basic geographical skeleton (i.e. the 1 hectare CLC2018 accounting layer).</p>

	<p>2) CLC agriculture classes (2.x.x) and CLC natural grassland (3.2.1) form the basis of delineation of the agricultural area mask.</p> <p>3) From these CLC classes non-agricultural patches (commissions which had originally been included in CLC due to the generalisation to the 25 ha minimum mapping unit) are excluded using the Copernicus High Resolution Layers (HRLs):</p> <p>- Woody vegetation (on the basis of FTY2018 100m layer: 0.5 ha, 10% tree cover density, no agricultural and urban trees), is excluded only from the following CLC classes: 211, 212, 213, 231, 242, 243, 321 – not from classes 2.2.x, 241 and 244,</p> <p>- Artificially sealed surfaces, with a sealing degree 30% (on the basis of IMD 100m density layer),</p> <p>- Permanent water surfaces larger or equal than 0.5ha are identified and excluded from AA based on 10m resolution HRL WAW2018 layer. Larger or equal than 0.5 ha contiguous (8 cell neighbourhood) permanent water (class 1) areas are identified in WAW layer in a first step. Secondly, a 100m resolution “Permanent Water density” (PWA) layer is created by aggregation. Permanent water density 45% was used to exclude permanent water surfaces from step 3 AA result.</p> <p>4) Larger areas covered by greenhouses (permanent, often “industrial” as well as temporary greenhouses) which are included in CLC under artificial areas are added to the AA mask in a separate step:</p> <p>- by importing them from the local component 2018 data (Riparian Zones, N2K, Coastal Zones) (code 212) and</p> <p>- by visual interpretation: contiguous areas larger than 20 hectares originally included to AA areas but filtered out by IMD 30% criteria are checked visually. If identified as greenhouse, they are added to AA areas.</p>
