

Forest patches 2018 based on Copernicus HRL Forest products - version 1, Jun. 2021

This metadata refers to the raster dataset providing information about European forest patches in 2018 covering the EEA38 member states and the United Kingdom. The data show the extent and the location of these forest patches.

The methodology behind the dataset has been developed by JRC and is designed to provide a first overview and concise summary of the location and size class distribution of forest patches in a given forest map. The methodology provides a map product together with a statistical summary for a series of forest area classes. The forest area size classes can be used to describe the forest patch distribution at a given point in time, to directly compare the size distribution of different sites, as well as for temporal analysis which is of key importance in questions of landscape connectivity, restoration, risk assessment, habitat suitability and biodiversity studies (Vogt et al., 2019a, 2019b).

Details on the methodology, are described in Accounting-Manual, which is included in the GuidosToolbox software; Soille & Vogt, 2008.

Explanation	See the referenced specification

Statement	<p>The dataset provides information about European forest patches in 2018, showing the extent and the location of these forest patches. The raster value is the identifier (ID) of each independent forest patch. The dataset is the result to apply the Accounting module on the forest pixels identified by the Copernicus HRL Forest Type (FTY) 2018 status layer at 100m spatial resolution covering the all EEA38 member countries and the United Kingdom. The FTY layer was converted to binary forest mask (forest/non-forest). By the Accounting sub-tool of GUIDOS toolbox, the independent forest patches are identified and labelled with unique object ID. A forest patch becomes independent if not a single '8-connection' to an adjacent forest pixel exists. All pixels connected by 'touching' at a corner point belong to the same patch.</p> <p>The methodology was developed by JRC. Details on the methodology and processing are described in Accounting-Manual, which is included in the GuidosToolbox software; Vogt & Riitters (2017) and Soille & Vogt (2008).</p> <p>https://ies-ows.jrc.ec.europa.eu/gtb/GTB/psheets/GTB-Objects-Accounting.pdf</p> <p>Vogt P, Riitters, K, 2017.
