

Impervious Built-Up 2021 (raster 10 m), Europe, 3-yearly, Jun. 2025

The Impervious Built-Up (IBU) 2021 layer is part of the High Resolution Layer (HRL) Imperviousness and provides binary information of built-up areas (class 1) and non built-up areas (class 0) for the reference year 2021 as derived from Sentinel-2 image time series. The production of the HRL Imperviousness is coordinated by EEA in the frame of Copernicus, the Earth observation component of the European Union's Space programme.

The product is a raster dataset with 10-meter grid spacing (spatial resolution) that covers the 38 Eionet member and cooperating countries as well as the United Kingdom (i.e. EEA38+UK). It is distributed as 100 x 100 km tiles that are fully conformant with the EEA reference grid.

Report

Result

Title	Commission Regulation (EU) No 1089/2010 of 23 November 2010 implementing Directive 2007/2/EC of the European Parliament and of the Council as regards interoperability of spatial data sets and services
Date (Publication)	2010-12-08
Explanation	See the referenced specification

Resource lineage

Statement	<p>The Impervious Built-Up status layer differentiates built-up areas (those with physical structures such as above-ground constructions and larger buildings) from other impervious surfaces (e.g., paved surfaces or roads).</p> <p>Input data:</p> <p>Copernicus Sentinel-2 imagery (L2A) acquired from January to December for the reference year 2021.</p> <p>Pre-processing:</p>
------------------	--

A data reduction algorithm was applied on of the Sentinel-2 time-series to obtain a set of band quantiles. Additionally, a combination of polynomial and harmonic functions were fitted to the time-series of Normalized Difference Vegetation Index (NDVI) to derive harmonic coefficients.

Training data:

Sentinel-2 quantiles 2018, Open Street Maps, Microsoft Building Footprints and Google Open Buildings datasets.

Classification and prediction:

A modified deep convolutional neural network (CNN) called U-Net was trained. The trained model was applied to the Sentinel-2 harmonics and quantiles input to predict built-up densities for the reference year 2021.

Post-processing:

Binarization of the predicted built-up densities layer by applying a threshold of 10%.

Changes to previous release (2018):

- Introduction of a new production system and algorithm (U-Net CNN).
- Reduction of in-situ data dependency for dataset production.
- First Impervious Built-up Change (IBUC) layer (2018-2021).
