

Reference Land Cover Change in Cross River-Takamanda-Mt Cameroon-Korup 2000-2015 (vector) - version 1, Feb. 2020

This metadata refers to the Land Cover Change vector data generated over Cross River-Takamanda-Mt Cameroon-Korup (Africa) in the framework of the Copernicus Global Land Hot Spot Mapping (C-GL-HSM) contract under the coordination of JRC.

This area of interest is either mapped with the generic 8 classes dichotomous legend (CAF_01_lcc_a) or the detailed (CAF_01_lcc_b) modular legend.

The mapped area of interest (AOI) represents a key landscape for conservation area (KLC).

This transboundary KLC has a total size of almost 8 million ha (80,000 km²) and is situated between the border of Nigeria and Cameroon. It includes several areas under protection including:

In the north-eastern sector the National Parks of Faro, Gashaka-Gumti and Tchabal Mbabo. This area is characterised mainly by savannah grassland and some very mountainous regions with mountain forests. Gashaka-Gumti is Nigeria's largest National Park (6730 km²) established for the conservation of biodiversity and for the support of rural development and traditional livelihood.

Reference time: 2000 - 2015

Additional Information	<p>The central part of the AOI is characterized by the presences of several protected areas (forest reserves or wildlife sanctuary, parks, etc.) among which the most extended are Kashimbila game reserve and Kimbi-Fungom National Park. Finally, the southern part is home to four main National Parks, including: Cross River National Park which is characterized by two separate sections, Okwangwo in the north, and Oban in the south. The park has one of the oldest rainforests in Africa, and has been identified as a biodiversity hot spot.</p> <p>Adjacent on the Cameroon side is the Korup National Park, also distinguished by undisturbed primary forest. The Takamanda National Park has been established in 2008 to protect the endangered cross river gorilla.</p> <p>Lastly, the Mount Cameroon National Park on the coast in the Gulf of Guinea represents another biodiversity hotspot. The peak denotes the highest mountain in west and central Africa (4070 m altitude). The vegetation zones stretch from evergreen lowland rain forests near sea level through sub-montane and montane forest (here some of the wettest places in the World with 10,000 mm rain fall can be found), to montane and sub-alpine grassland on the top. Mount Cameroon is also an active volcano.</p> <p>The World Database on Protected Areas (WDPA 2019) has been used in the Copernicus Global Land Hot Spot mapping (C-GL-HSM) contract under the coordination of JRC to obtain statistics on land cover changes inside and outside the protected areas.</p> <p>To see how much of the Key Landscapes for Conservation area is a Protected Area, consult the WMS service found at the Service section of this metadata.</p>

Statement

e-GEOS Production Site produced this product by satellite analyses in the context of the Copernicus Global land Hot Spot Mapping (C-GL-HSM) framework.

Data and products are based on medium to high and very high resolution satellite images (from approximately 1 to 30m spatial resolution) with a change assessment frequency between 1 to 20 years. The Image data sources used for mapping are Landsat 7 and 8. The validation process made use of Spot-6 and Sentinel-2 images as reference data.

Images temporal range: 1997-2003

It is the time frame that has been accepted to collect the satellite images useful to produces the vector data.

The Reference year is included in this time frame and correspond to mean year considering all the image's year used. It is the year on which the majority of the used images are.

The classification scheme follows the Land Cover Classification System (LCCS) developed by the United Nations Food and Agriculture Organization (FAO).

Since LCCS is a hierarchical system, the modular legend can be aggregated to the dichotomus legend.

The FAO LCCS handbook which describes each class in detail, can be downloaded here: <http://www.fao.org/3/a-i5232e.pdf>

This LCCS Land Cover map includes the following land cover classes (associated raster code in []):

A11 - Cultivated and Managed Terrestrial Area(s) [3]

A12 - Natural And Semi-Natural Primarily Terrestrial Vegetation [4]

A23 - Cultivated Aquatic or Regularly Flooded Area(s) [6]

A24 - Natural And Semi-Natural Aquatic or Regularly Flooded Vegetation [7]

B15 - Artificial Surfaces and Associated Area(s) [0]

B16 - Bare Area(s) [11]

B27 - Artificial Waterbodies, Snow and Ice [13]

B28 - Natural Waterbodies, Snow and Ice [14]

The produced and independently validated Land Cover and Land Cover Change maps and statistics are available to global users.

The report and the validation file can be downloaded from the link section.

Basic image processing: Cloud/Shadow masking, Data Selction (based on occlusion and sesonality considerations), Atmospheric correction (TOA) of satellite data, Coregistration.

Automatic classification: Feature extraction from Dense Multitemporal Time Series (D MTS), statistics generation, automatic classificaion (ROI based or decision tree) and labeling according to the required output LCCS legend schema.

Visual inspection and refiment: check and refinement of the LCCS product generated through the automatic procedure in order to corrected classification errors and to refine borders where necessary.

Internal validation: independent validation of the LCCS product based on external reference data (where available) and on other datasets for intercomparison. The scope of the internal validation is to make a qualitative and quantitative check of the declared Thematic and Positional accuracies.
