

Reference Land Cover in Comoe-Mole 2015-2018 (vector) - version 1, June 2018

This metadata refers to the Land Cover vector data generated over Comoe-Mole (Africa) for 2015 in the framework of the Copernicus Global Land Hot Spot Mapping (C-GL-HSM) contract under the coordination of JRC. This area of interest is mapped with the generic 8 classes dichotomus legend (WAF_05_lc_a file).

The mapped area of interest (AOI) represents a Key Landscape for Conservation area (KLC). The KLC has a total size of 4 million ha (40,000 km²) and is located in the northern part of the countries of Ghana and Côte d'Ivoire. The Comoe National Park with a size of 1,149,150 ha (11,491.5 km²) has been designated in 1968 and recognized as UNESCO World heritage site in 1983. The Mole National Park has an area of 484,040 ha (4,840.4 km²) and has been established in 1971. The parks are within the Guinean forest-savanna mosaic (only Comoe) and west Sudanian savanna eco-region.

Reference time: 2015 - 2018

Maintenance and update frequency	Not planned
GEMET - INSPIRE themes, version 1.0	- Human health and safety - Land cover
Keywords	
Continents, countries, sea regions of the world.	- Ghana - Africa - Côte d'Ivoire
Keywords	
GEMET	- landscape alteration - landscape - land

	- land use - land cover
Spatial scope	Regional
EEA topics	- Environmental health impacts - Land use
Temporal resolution	Not planned
Access constraints	Other restrictions
Other constraints	no limitations to public access
Use constraints	Other restrictions
Other constraints	Access to data is based on a principle of full, open and free access as established by the Copernicus data and information policy Regulation (EU) No 1159/2013 of 12 July 2013. This regulation establishes registration and licensing conditions for GMES/Copernicus users. Free, full and open access to this data set is made on the conditions that: - When distributing or communicating Copernicus dedicated data and Copernicus service information to the public, users shall inform the public of the source of that data and information. - Users shall make sure not to convey the impression to the public that the user's activities are officially endorsed by the Union. - Where that data or information has been adapted or modified, the user shall clearly state this. - The data remain the sole property of the European Union. Any information and data produced in the framework of the action shall be the sole property of the European Union. Any communication and publication by the beneficiary shall acknowledge that the data were produced "with funding by the European Union".
Spatial representation type	Vector

Additional Information	The overall climate is characterized by a rainy season from March until October and a dry season from November to February. The elevation ranges from 125 m to 587 m within both National Parks. The Comoe Park shows a steep climatic north-south gradient, allowing the park to harbor a multitude of habitats with a remarkable diversity of life. It is also the largest protected area in west Africa. The Mole park is an important study area for scientists because of the removal of the human population from within the park allowing for some long-term studies, in particular, of relatively undisturbed sites compared to similar areas of densely populated equatorial west Africa. The World Database on Protected Areas (WDPA 2019) has been used in the Copernicus Global Land Hot Spot mapping (C-GL-HSM) contract under the coordination of JRC to obtain statistics on land cover changes inside and outside the protected areas. To see how much of the Key Landscapes for Conservation area is a Protected Area, consult the WMS service found at the Service section of this metadata.

Pass	Yes

Statement	e-GEOS Production Site produced this product by satellite analyses in the context of the Copernicus Global land Hot Spot Mapping (C-GL-HSM) framework. Data and products are based on medium to high and very high resolution satellite images (from approximately 1 to 30m spatial resolution) with a change assessment frequency between 1 to 20 years. The Image data sources used for mapping are Landsat 7 and 8. The validation process made use of Spot-6 and Sentinel-2 images as reference data. Images temporal range: 2014-2018 It is the time frame that has been accepted to collect the satellite images useful to produces the vector data. The Reference year is included in this time frame and correspond to mean year considering all the image's year used. It is the year on which the majority of the used images are. The classification scheme follows the Land Cover Classification System (LCCS) developed by the United Nations Food and Agriculture Organization (FAO). Since LCCS is a hierarchical system, the modular legend can be aggregated to the dichotomus legend. The FAO LCCS handbook which describes each class in detail, can be downloaded here: http://www.fao.org/3/a-i5232e.pdf This LCCS Land Cover map includes the following land cover classes (associated raster code in []): A11 - Cultivated and Managed Terrestrial Area(s) [3] A12 - Natural And Semi-Natural Primarily Terrestrial Vegetation [4] A23 - Cultivated Aquatic or Regularly Flooded Area(s) [6] A24 - Natural And Semi-Natural Aquatic or Regularly Flooded Vegetation [7] B15 - Artificial Surfaces and Associated Area(s) [0] B16 - Bare Area(s) [11] B27 - Artificial Waterbodies, Snow and Ice [13] B28 - Natural Waterbodies, Snow and Ice [14] The produced and independently validated Land Cover and Land Cover Change maps and statistics are available to global users. The report and the validation file can be downloaded from the link section. Basic image processing: Cloud/Shadow masking, Data Seltction (based on occlusion and sesonality considerations), Atmospheric correction (TOA) of satellite data, Coregistration. Automatic classification: Feature extraction from Dense Multitemporal Time Series (D MTS), statistics generation, automatic classificaiton (ROI based or decision tree) and labeling according to the required output LCCS legend schema. Visual inspection and refiment: check and refinement of the LCCS product generated through the automatic procedure in order to corrected classification errors and to refine borders where necessary. Internal validation: independent validation of the LCCS product based on external reference data (where available) and on other datasets for intercomparison. The scope of the internal validation is to make a qualitative and quantitavie check of the declared Thematic and Positional accuracies.
