

Reference Land Cover in Cross River-Takamanda-Mt Cameroon-Korup 2015-2019 (vector) - version 1, Feb. 2020

This metadata refers to the Land Cover vector data generated over Cross River-Takamanda-Mt Cameroon-Korup (Africa) for 2016 in the framework of the Copernicus Global Land Hot Spot Mapping (C-GL-HSM) contract under the coordination of JRC.

This area of interest is either mapped with the generic 8 classes dichotomus legend (CAF_01_lc_a) or the detailed modular legend (CAF_01_lc_b).

The mapped area of interest (AOI) represents a key landscape for conservation area (KLC).

This transboundary KLC has a total size of almost 8 million ha (80,000 km²) and is situated between the border of Nigeria and Cameroon. It includes several areas under protection including:

In the north-eastern sector the National Parks of Faro, Gashaka-Gumti and Tchabal Mbabo. This area is characterised mainly by savannah grassland and some very mountainous regions with mountain forests. Gashaka-Gumti is Nigeria's largest National Park (6730 km²) established for the conservation of biodiversity and for the support of rural development and traditional livelihood.

Access constraints	Other restrictions
Other constraints	no limitations to public access
Use constraints	Other restrictions
Other constraints	Access to data is based on a principle of full, open and free access as established by the Copernicus data and information policy Regulation (EU) No 1159/2013 of 12 July 2013. This regulation establishes registration and licensing conditions for GMES/Copernicus users. Free, full and open access to this data set is made on the conditions that: 1. When distributing or communicating Copernicus dedicated data and Copernicus service information to the public, users shall inform the public of the source of that data and information. 2. Users shall make sure not to convey the impression to the public that the user's activities are officially endorsed by the Union. 3. Where that data or information has been adapted or modified, the user shall clearly state this. 4. The data remain the sole property of the European Union. Any information and data produced in the framework of the action shall be the sole property of the European Union. Any communication and publication by the beneficiary shall acknowledge that the data were produced "with funding by the European Union".

Statement	e-GEOS Production Site produced this product by satellite analyses in the context of the Copernicus Global land Hot Spot Mapping (C-GL-HSM) framework. Data and products are based on medium to high and very high resolution satellite images (from approximately 1 to 30m spatial resolution) with a change assessment frequency between 1 to 20 years. The Image data sources used for mapping are Landsat 7 and 8. The validation process made use of Spot-6 and Sentinel-2 images as reference data. Images temporal range: 2013-2019 It is the time frame that has been accepted to collect the satellite images useful to produces the vector data. The Reference year is included in this time frame and correspond to mean year considering all the image's year used. It is the year on which the majority of the used images are. The classification scheme follows the Land Cover Classification System (LCCS) developed by the United Nations Food and Agriculture Organization (FAO). Since LCCS is a hierarchical system, the modular legend can be aggregated to the dichotomus legend. The FAO LCCS handbook which describes each class in detail, can be downloaded here: http://www.fao.org/3/a-i5232e.pdf This LCCS Land Cover map includes the following land cover classes (associated raster code in []): A11 - Cultivated and Managed Terrestrial Area(s) [3] A12 - Natural And Semi-Natural Primarily Terrestrial Vegetation [4] A23 - Cultivated Aquatic or Regularly Flooded Area(s) [6] A24 - Natural And Semi-Natural Aquatic or Regularly Flooded Vegetation [7] B15 - Artificial Surfaces and Associated Area(s) [0] B16 - Bare Area(s) [11] B27 - Artificial Waterbodies, Snow and Ice [13] B28 - Natural Waterbodies, Snow and Ice [14] The produced and independently validated Land Cover and Land Cover Change maps and statistics are available to global users. The report and the validation file can be downloaded from the link section. Basic image processing: Cloud/Shadow masking, Data Seltcion (based on occlusion and sesonality considerations), Atmospheric correction (TOA) of satellite data, Coregistration. Automatic classification: Feature extraction from Dense Multitemporal Time Series (D MTS), statistics generation, automatic classificaiton (ROI based or decision tree) and labeling according to the required output LCCS legend schema. Visual inspection and refiment: check and refinement of the LCCS product generated through the automatic procedure in order to corrected classification errors and to refine borders where necessary.
-----------	--

Internal validation: independent validation of the LCCS product based on external reference data (where available) and on other datasets for intercomparison. The scope of the internal validation is to make a qualitative and quantitavie check of the declared Thematic and Positional accuracies.
