1 Introduction

The EU and global biodiversity targets for 2020 call for an enhanced capability of monitoring, reporting and assessing progress in the thematic area of biodiversity. A review of the available tools used to describe components of biodiversity at a European scale is a necessary preparatory action to meet the needs of the new biodiversity targets.

The EEA hosts and maintains the biodiversity data centre, where European data sets and information on sites, species and habitats of Europe are published. Together with data sets provided by other environmental data centres, these data sets support the assessment of progress in achieving biodiversity targets as shown in the Biodiversity Information System for Europe (BISE). BISE, along with the Water Information System for Europe (WISE), anticipates an integration of ecosystem assessment across Europe.

The EEA has developed the European Nature Information System (EUNIS) habitat classification and maintains it as part of the biodiversity data centre. The aim of the EUNIS habitat classification (Davies & Moss 1999) is to provide a pan-European reference set of habitat units with a common unit description within a hierarchical classification aiming to fulfil specific objectives and support specific applications related to biodiversity monitoring and reporting at the European scale. Such applications include reporting for the implementation of the EU Habitats Directive and the Bern Convention, as well as providing information in the context of the Common Agricultural Policy (CAP) and the Regional Development Funds. A European standard list of habitat types is also necessary for the implementation of the INSPIRE Directive, to which other national or regional classifications will have to make reference to be comparable.

Further to the above, the EEA is participating in the Mapping and Assessment of Ecosystems and their Services (MAES), an activity within the framework of the EU Biodiversity Strategy. Relevant to this activity, and in support of the ecosystem assessment of Europe, is the development of a baseline for documenting, monitoring and assessing the quality of habitats across Europe, by analysing existing in situ vegetation monitoring data in accordance with the EUNIS habitat classification.

The aim of this contract is to provide distribution maps and descriptions of EUNIS grassland habitat types. The requested services are building on the outcomes of work package 1 under Service contract 3417/B2015/EEA.56197, of which the results were published earlier this year (Schaminée et al. 2016). The grassland habitat types in focus are included under habitat group E (Grasslands), specifically subgroups E1, E2, E3 and E4 and, if appropriate, subgroups E5 and E6, as well as grasslands included under habitat group B, subgroups B1.4 (Coastal stable dune grassland) and B1.9 (Machair), on the basis of in situ vegetation measurements across Europe. The mapping of

distribution of phytosociological relevés for the grasslands will be based on lists of indicator species, derived from the analysis of vegetation databases across Europe. The maps and the data supporting them are intended to be used in the EUNIS website and also for modelling the predicted habitat suitability of these habitats across Europe for each of the grassland habitat types.

The assessment of the EUNIS grassland habitat types fits in a series of projects, that started in 2012 with a project to revise the crosswalk of EUNIS to phytosociological syntaxa (Rodwell et al. 1998, 2002) and to inform on the capacity of in situ vegetation recording for demonstrating trends in habitat diversity and quality (Schaminée et al. 2012). The actual underpinning of the EUNIS classification with in situ vegetation plot data was the next step. As a first group of habitat types the forests were considered, resulting in the EEA technical report *Review of EUNIS forest habitat classification* (Schaminée et al. 2013). A second group of habitat types (heathland, scrub and tundra vegetation) was the subject of an EEA project that was carried out in 2014 (Schaminée et al. 2014).

As mentioned in the 2016 report, Grasslands are of great importance in European nature policy, of widespread distribution, housing a large proportion of the biodiversity in this part of the world, and everywhere under threat. The existing descriptions are insufficient and inadequately supported by in situ vegetation data which limit the usability of the EUNIS habitat classification.

The objectives of the project were specified as tasks in the Annex I of the tender specifications (EEA/NSS/16/003) and elucidated in the Inception Report (February 2016, Service Contract No. 3417/B2016/EEA.56510):[1]

Task 2 To prepare lists of 'indicator species' of all grassland habitat types (level 3) based on vegetation database analyses, taking into account the outcome of work package 1 of Service contract 3417/B2015/EEA.56197.

Task 3 To prepare maps of distribution of phytosociological relevés for each of the grassland habitat types for which fact sheets are provided in work package 1 of Service contract 3417/B2015/EEA.56197.

Task 4 To provide descriptions, in the standard format, for each of the grassland habitat types, and to provide input for relevant updates in relation to grasslands for each alliance of the EuroVegChecklist to the EUNIS-

[1] Task 1 of the Work Package concerned the Inception Report. The approach to the work was discussed at a meeting on the results of the previous grassland project (Service contract 3417/B2015/EEA.56197) at the European Environment Agency in Copenhagen on the 22nd of February 2016, attended by Mette Palitzsch Lund (EEA project manager), Annemarie Bastrup-Birk (EEA Copenhagen), Joop Schaminée, Stephan Hennekens (both Alterra Wageningen, The Netherlands), John Rodwell (Lancaster, UK), Milan Chytrý (Masaryk University, Brno, Czech Republic), and – by teleconferencing – Doug Evans (ETC-BD Paris).

EuroVegChecklist crosswalks of 2012 (in case changes have been introduced to the latter).

With the agreement of the EEA, also included in this report is a chapter on relationships between the EUNIS revision process and the European Red List of Habitats (hereafter Red List) and an indication of how this convergence might be taken forward.

2 Scope of the project

2.1 Background

In 2015, the European Environment Agency (EEA) launched an open call for tender No EEA/NSV/15/005 aiming at the 'Review of grassland habitats and development of distribution maps of heathland/scrub habitats of EUNIS habitats classification'. The tender specifications foresaw the possibility of awarding a separate service contract to the successful tenderer for documenting each of the revised EUNIS grassland habitats with lists of indicator species, distribution maps of plot observations (phytosociological relevés) and descriptions in a standardized format.

The work would include all EUNIS grassland habitat types as listed under habitat group E (Grasslands), specifically subgroups E1, E2, E3 and E4 and, if appropriate, subgroups E5 and E6, as well as grasslands included under habitat group B, subgroups B1.4 (Coastal stable dune grassland) and B1.9 (Machair), on the basis of in situ vegetation records across Europe. The selection of relevant habitat types was discussed in detail during the work on the previous contract, in close collaboration with the DG Environment project European Red List of Habitats (hereafter Red List). It was decided to consider here those EUNIS E habitat types that are natural or semi-natural vegetation dominated by grasses, or grasses and herbs, and to treat the rest of the habitat types elsewhere (see further under Chapter 6).

The result of this decision was that the habitat types E5.2 (Thermophilous woodland fringe[2]), E5.4 (Moist or wet tall-herb and fern fringe of the lowlands), E5.5 (Subalpine moist or wet tall-herb and fern stand), as well as both habitat types of subgroup E6 (E6.1 Mediterranean inland salt steppe and E6.2 Continental inland salt steppe) have been taken into account now. The EUNIS categories E7 (Wooded pasture and meadow) were not dealt with, as these types are complexes of different vegetation types. The same applies to B1.9 (Machair), as was discussed in the previous report (Par. 3.3). The habitat type was concerned to be a vegetation complex as well as – more restricted – a grassland habitat type. Floristically the grassland part has the same content as the Irish and Scottisch representatives of the revised habitat type B1.4a (Atlantic and Baltic coastal dune grasslands). Several habitat types of the E group have been omitted as these types must be merged with other habitat types (see Par. 3.2 of the previous report). This applies to E1.4 (Mediterranean tall grass and Artemisia steppes), E2.5 (Meadows of the steppe zone) and E4.2 (Moss and lichen dominated mountain summits, ridges and exposed slopes). Habitat type E1.4 was partly merged with E1.3b (Mediterranean tall perennial dry grassland) and partly with F6.8a (Mediterranean halo-nitrophilous scrub) and F6.8b (Caspian Sea halo-

[2] Habitat names follow the revisions summarised in Appendix A.

nitrophilous scrub). E2.5 is now included in E1.2a (Sem-dry perennial calcareous grassland). E4.2 is moved in the EUNIS revision to group H (Inland unvegetated or sparsely vegetated habitats). A special case is habitat type E1.1c (Boreal open, sub-thermophilous grassland on shallow soils on siliceous rock outcrops), that was proposed in the previous report as a new EUNIS habitat type, but was merged in the Red List project with habitat type E1.1b (Temperate and boreal pioneer grassland on shallow soils on silicious rock outcrops), a decision we are following now. Some habitat types were omitted as they are not grasslands, such as E1.C (Dry mediterranean lands with unpalatable non vernal herbaceous vegetation) and E5.3 (Pteridium aquilinum stand), having not a clear definition, such as E1.D (Unmanaged dry grassland), E2.7 (Unmanaged mesic grassland) and E2.8 (Trampled mesophilous grasslands with annuals), or are anthropogenic/agricultural habitats, such as E1.6 (Subnitrophilous annual grassland), E2.6 (Agriculturally-improved, re-seeded and heavily fertilised grassland, including sports fields and grass lawns), E1.E (Trampled dry grassland with annuals) and E5.1 (Anthropogenic herb stands). It still is an open question how to treat these in the final EUNIS classification; they probably will have to be reallocated. In total, 32 of the original EUNIS grassland habitat types will be considered as target habitat types (54 redefined types, see Appendix A).

2.2 Review of the EUNIS grassland habitat types

In the 2012 (crosswalks), 2013 (forests), 2014 (heathlands, scrubs and tundras) and 2016 (grasslands I) research reports provided by our consortium for the EEA, it has been shown how the classification of vegetation types and its underlying *in situ* data, as provided by phytosociologists throughout Europe, could support the use of reference systems of habitat types for policy making, such as the EUNIS habitat classification (Davies & Moss 1999; Davies et al. 2004; Moss 2008). For a short overview of backgrounds and developments in vegetation research and the current availability of software packages for processing phytosociological data, such as JUICE (Tichý 2002) and TURBOVEG (Hennekens & Schaminée 2001), we refer to these reports; here, we will only mention two important initiatives that were launched during the last decade: the *EuroVegChecklist* and *European Vegetation Archive*.

The *EuroVegChecklist* is an attempt to achieve a respectable level of stability in European vegetation classification, by providing a comprehensive overview of vegetation units at the levels of alliances, orders and classes, based on expert revision by a team under the leadership of Professor Ladislav Mucina. It reviews and integrates the massive number of formally described plant communities at all levels in national and regional studies, covering all Europe as well as territories such as the Azores, Canary Islands, Cyprus, Caucasus and Greenland. A first version was submitted to the journal *Applied Vegetation Science* in 2013 for publication and after review and further

revisons will be published before the end of this year (Mucina et al. 2016). Under the name *Vegetation of Europe*, it comprises hierarchical floristical classification systems of not just vascular plant communities, but also of bryophyte, lichen and algal communities. The vascular plant communties include 109 classes, 300 orders and 1108 alliances.

The *European Vegetation Archive* (EVA) is a centralized database of European vegetation plots. It stores copies of national and regional vegetation-plot databases on a single software platform. The management of multiple databases is facilitated by the SynBioSys Taxon Database, a system of taxonomic names and concepts used in the individual databases and their matches to a unified list of European flora. Data storage in EVA does not affect the ongoing independent development of the contributing databases, which remain the property of the data contributors (www.euroveg.org/eva-database). By November 2016, more then 60 databases from all European regions, have joined EVA. The centralised database contained in total 1,288,171 vegetation plots from most European regions, especially from western, central and southern Europe (see Figure 2.1). However, there still is a lack of data from Scandinavia and eastern European countries, i.e. Europe-

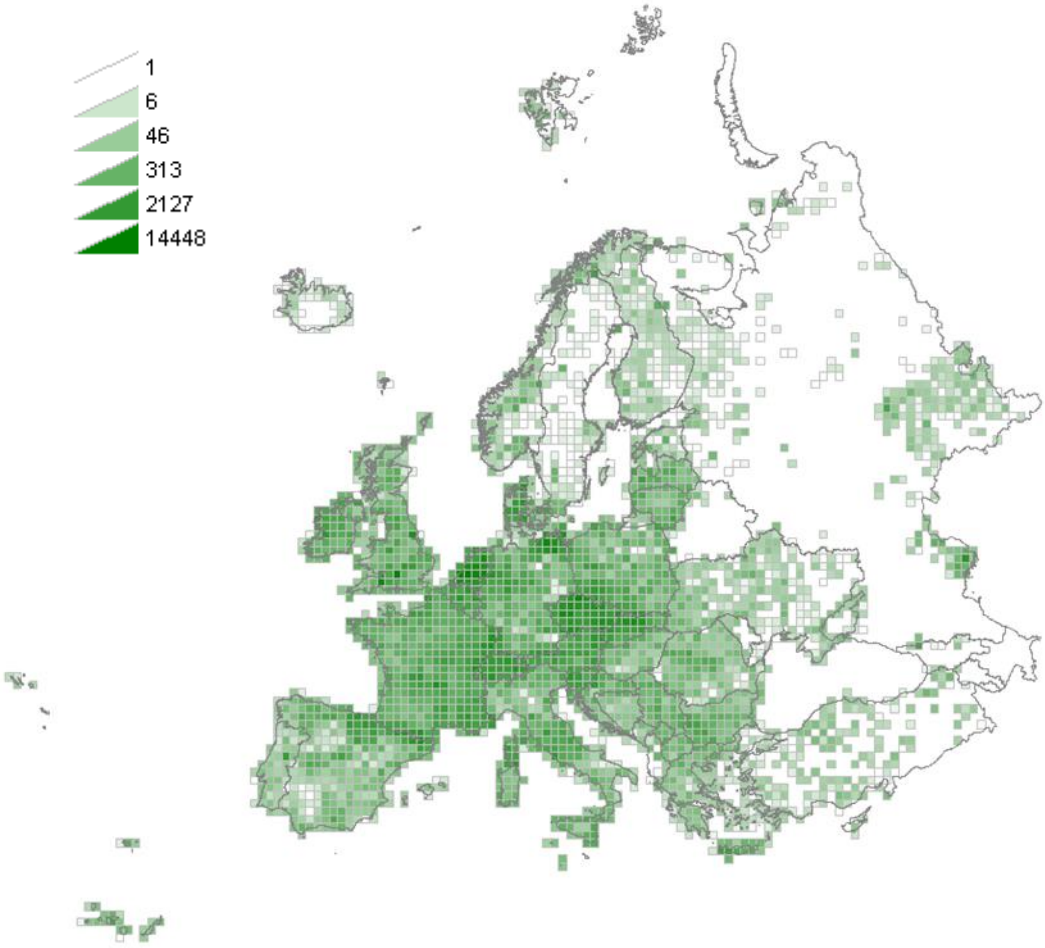

Figure 2.1. Density of all georeferenced plots in EVA in 50 x 50 km grid cells at 6-11-2016 (based on 1,288,171 plots).

an regions with less strong or interrupted phytosociological traditions. The majority of these plots (87%) have geographic coordinates.

The EUNIS grassland habitat types were reviewed in line with the recommendations for improving the EUNIS forest habitat classification (Schaminée et al. 2013) and the heathland, tundra and scrub classification (Schaminée et al. 2014), of which the results were published in the 'Grassland I report' earlier this year (Schaminée et al. 2016). Again, two types of recommendations were proposed, one concerning the classification itself, with recommendations for new units by splitting and merging existing units, and one dealing with their naming (see the EEA 2013 report fur further details).

Our main conclusion was that the EUNIS grassland habitat types are generally too broad and therefore should be divided. The proposed revision is mainly based on floristic composition, whereas EUNIS sometimes follows a division based on vegetation stucture (for example open and closed grassland). The level of the Order in syntaxonomy proves to be especially appropriate for making distinctions. The proposed classification based on species composition brings together grasslands with a similar soil, hydrology and management. Quite often these grasslands are zonal, being related to particular climatic conditions, and so confined to a specific geographic region, which can be reflected in the name (boreal, continental, submediterranean, and so on).

Discussions between the EEA, the ETC-BD and the team working on the DG Environment Red List (Rodwell et al. 2013, Janssen et al. 2016) resulted in a clear desire for close collaboration, ensuring a harmonisation of the two habitat typologies. As both programmes have a different time line, the Red List adopted for its typology of forest habitats and heathland, scrub and tundra habitats the revised classification of the 'EUNIS Project' almost without exception[3], whereas the grasslands habitat types were reviewed in a joint effort. In coming projects, the Red List typology will be a strong guidance for the aimed revision of the EUNIS classification (see further under Chapter 7).

[3] The very few exceptions are described in Paragraph 6.2 and highlighted in Appendix A.

3 Indicator species of the revised EUNIS grassland habitat types

3.1 Background

In our April 2016 report (Schaminée et al. 2016), vegetation plots (phytosociological relevés) representing EUNIS habitat types of grasslands were identified in the databases of the Braun-Blanquet project and in the European Vegetation Archive (EVA; Chytrý et al. 2016) using a crosswalk between syntaxa (phytosociological alliances) and EUNIS habitat types (Schaminée et al. 2012, with later updates). This work identified gaps in the data and enabled subsequent targeted gap filling. At the same time, a computer expert system for identification of EUNIS habitat types of heathlands, scrub and tundra was created and indicator species of these habitats were identified. The expert system of EUNIS habitat types of forests was updated and a corresponding update of the indicator species lists for forest habitats was provided (Schaminée et al. 2016).

The main methodological principles of the previous work were the following:

1) Identification of EUNIS habitat types in a large European database of vegetation plots was done using a newly developed computer expert system. This expert system comprised formal definitions of individual habitats, which were used to identify vegetation plots belonging to these habitats in the database. The expert system approach has the following advantages: (i) it applies habitat classification consistently across the whole of Europe, unlike classifications based on expert assignments to phytosociological alliances, which depend on subjective judgement of various experts and varying regional traditions; (ii) it enables identification of vegetation plots that have not been labelled by the alliance names; (iii) it can be used to classify any vegetation plot obtained in the future using the same criteria.

2) Indicator species of habitat types were obtained through statistical analysis of the groups of vegetation plots classified by the expert system. Three types of indicator species were provided: diagnostic species, constant species and dominant species. Each of these types of indicator species has a different meaning and together they provide a comprehensive characterization of the habitat's species diversity. Diagnostic species are species with occurrences concentrated in the habitat, being absent or rare in other habitats. As such they are good positive indicators of the habitat, but they do not need to be present at every site where the habitat occurs. Constant species are species frequently occurring in the habitat, but they may include generalist species that are also frequent in other habitats. Dominant species are those that often reach high cover in the habitat, thus determining the habitat physiognomy.

In this report we extend the previously developed expert system for EUNIS habitat groups G (Forests) and F (Heathlands, scrub and tundra) to cover also group E (Grasslands). However, European grassland habitats are generally defined based on different principles than forests, heathlands and scrub. While woody habitats of groups F and G can be defined based mainly on the dominance of a few species of trees and shrubs (e.g. beech forest habitats are defined by the dominance of *Fagus*), grasslands are species-rich ecosystems with a less prominent dominance structure, or with dominant species changing in space and time. Therefore most grassland habitats have to be defined based on the total species composition, which required a different methodological approach to be used in the expert system. We developed such an approach together with a software solution in the framework of the current project. Here we present both this new approach and the resulting classification of European vegetation plots to the revised EUNIS grassland habitat types.

3.2 Expert system method to classify grassland habitats

The expert system for automatic classification of vegetation plots to habitat types was developed within this project as a software tool implemented in the JUICE 7 software and, in a simpler form, also in the Turboveg 3 software. This software uses the formal definitions of individual habitat types which are defined as logical formulas in an editable script stored as a TXT file. All plots from a vegetation database submitted to the software are checked as to whether they meet the conditions of some of the formal definitions of habitats included in this script. If they do, they are assigned to this habitat.

The information used by the expert system includes the species composition of vegetation plots and percentage cover of species. Species composition is identified using groups of species that are similar in their ecology or distribution ranges. Each group is indicated by a three-character string which indicates how the group is used in the expert system. The basic types of species groups are the following:

Sociological species groups. The concept of sociological species groups follows Bruelheide (1995, 2000) and Kočí et al. (2003). A species group of this type is considered to be present in a vegetation plot if more than a specified number of species of the group is present in the plot. In the expert system file these groups are defined with the string ### followed by the group name. When the ### string is used in the formula defining the habitat type, the minimum number of species is by default set to half of the total number of species of this group. This default setting is useful especially for classification to finely-divided habitat types that is based on small sociological groups that contain few species. However, broad habitat types such as those used in the revised EUNIS classification are usually characterized by many species, but only few of them co-occur at particular sites representing the habitat type. Therefore, smaller thresholds can be specified by replacing two

hashes by the minimum number of species required. For example, #03 followed by the group name used in the formula means that occurrence of at least three species of the group is required for the group to be considered as present in the plot.

Total-cover groups. The concept of total-cover groups follows Landucci et al. (2015). A species group of this type is considered to be present in a vegetation plot if the total cover of all species of the group exceeds a specified threshold. In the expert system file these groups are defined with the string ### followed by the group name, i.e. in the same way as the sociological species groups. The same species group can be therefore used both as a sociological species group and a total-cover group. The use of the group as a total-cover group is defined in the formulas by coding them with the string #TC and specifying the threshold cover. For example, <#TC Group-name GR 25> means that a group is considered to be present in the plot if its species have a total cover higher than 25% in this plot. This group can be represented by a single species with a cover higher than 25%, or several species, each with an individual cover lower than 25%, but with a cover exceeding 25% if their individual covers are combined. Covers are combined based on an algorithm implemented in the Juice program, assuming random overlap of covers of individual species. This algorithm was proposed by Chytrý et al. (2005) and recently formally described by Fischer (2015). Alternatively, a cover of single species can be used instead of the total cover of a species group. The total-cover groups or covers of single species are especially useful to identify habitat types that are defined based on the dominant species, e.g. heathland is a habitat determined by the dominance of a few species of ericoid dwarf shrubs. Therefore the total-cover groups and covers of single species were extensively used in the expert system to define forests and scrub habitats (Schaminée et al. 2016), but they are not useful for defining habitat types with weak and irregular dominance, particularly for grasslands.

Diagnostic species groups. The concept of diagnostic species groups follows Dengler et al. (2006) and Mucina et al. (2016). If this type of species group is used, each habitat type in the classification is represented by a single species group of this type, which includes its diagnostic species. One species can be assigned to more than one of these groups. The lists of the diagnostic for the expert system are initially prepared by compilation of the species lists published in the literature, which can be further modified based on statistical analysis of plots assigned to the habitat type. In the expert system file these groups are defined with the string ##D followed by the group name. A plot is assigned to that habitat type whose diagnostic species group is most represented in this plot. The measure of representation can be the number of species of the group (in that case the ##D string is used in the formulas), the total percentage cover of the group, based on the assumption of random overlap of individual species covers (##C) or the sum of square-rooted percentage covers of individual species (##Q). The last mentioned method provides an intermediate solution between the emphasis on species numbers and the emphasis on total species cover, which can, in some cases, lead to counter-intuitive classification (especially when a plot contain several species

of one habitat type with small cover and one species of another habitat type with high cover).

These three types of species groups can be combined in single formulas defining the habitat types. In the formulas the conditions defined by species groups are combined using the logical operators AND, OR and NOT, following the proposals of Bruelheide (1997), and also relational operators GR (= greater than) or GE (= greater than or equal to). To define habitat types characterised by dominance of single species or species groups (e.g. forests, scrub, marshes, aquatic vegetation), total-cover groups are often sufficient. For grasslands, however, the use of diagnostic species groups is necessary.

The expert system can be used in a hierarchical mode. In that case, the definitions with the highest priority are applied to the dataset first, resulting in habitat assignment of some plots, while other plots remain unclassified. Then, the definitions with lower priority are applied only to the plots that have not been classified by the plots of higher priority. Consequently, one habitat type can have two definitions. The definition applied at a higher priority level can be based on the occurrence of sociological species groups or total-cover groups that include species narrowly specialized to this habitat. This definition usually classifies those plots that are very typical examples of the habitat, but it leaves many less typical plots of this habitat unclassified. Subsequently a definition at a lower priority level, based on diagnostic species groups, is applied to unclassified plots. This definition classifies plots that are less typical examples of the habitat but still exhibit a higher degree of membership to this habitat than to any other habitat. For example, on the first priority level of classification the habitat type E11a Pannonian and Pontic sandy steppe is defined by the formula:

<#TC E11a-Pannonian-and-Pontic-sandy-steppe-specialists GR15> NOT (<#TC Trees GR05> OR <#TC Shrubs GR05>)

which means that total cover of the species group E11a-Pannonian-and-Pontic-sandy-steppe-specialists, including a selection of narrow specialists of this habitat, must have a cover greater than 15% and neither the groups of trees nor the group of shrubs can have a cover higher than 5%. Then, the following formula defining the same habitat is applied to the plots that were not classified by the formulas on the first priority level:

(<##Q E11a-Pannonian-and-Pontic-sandy-steppe> AND <#03 E11a-Pannonian-and-Pontic-sandy-steppe>) NOT (<#TC Trees GR05> OR <#TC Shrubs GR05>)

which means that the sum of square-rooted percentage covers of a group of typical species of this habitat (including both the narrow specialists and frequently occurring less specialized species) is higher than the sum of square-rooted percentage covers of any other diagnostic species group *and* the plot contains at least three species of this group *and* the total cover of both trees and shrubs does not exceed 5%.

3.3 Data and information sources used to create the expert system and habitat classification

The vegetation-plot dataset used for the analysis was compiled from the EVA database and the Braun-Blanquet project database. This data set contained a total of 1,288,169 vegetation plots from Europe, including a small number of plots from adjacent regions such as Greenland, Siberia, Anatolia and the Mediterranean coast of North Africa (see Figure 2.1). All vegetation types were included. The dataset was prepared using the Turboveg 3 program (S.M. Hennekens, unpublished) and analyzed using the Juice 7 program (Tichý 2002).

Taxon names in this dataset originated from several source databases, which use different taxon lists with partly inconsistent taxonomic concepts and nomenclature. Taxon names were unified in the Turboveg 3 program in two steps. First, names from the original databases were interpreted within a regional context, considering the taxonomic concepts and nomenclature used in the focal regions of each database. In this step, taxon lists of most of the databases (including all the largest ones) were matched to the SynBioSys Taxon Database, a working database of the EVA project that is not linked to a single taxonomic standard. Secondly, names from the SynBioSys taxon database and names from the original databases that did not match any name in the SynBioSys taxon database were translated to the nomenclature of Euro+Med PlantBase (Euro+Med 2006–2016; ww2.bgbm.org/EuroPlusMed), using an up-to-date list of accepted names and synonyms provided by Dr. Eckhard von Raab-Straube from the Botanischer Garten und Botanisches Museum Berlin-Dahlem in October 2016. Synonyms that can relate to more than one accepted name were assigned to one of these names following the prevailing use of this synonym in most of the modern European floras. The names from the SynBioSys Taxon Database or the names from the taxon lists of the source vegetation-plot databases were used for ca. 5% of European vascular plants that are not yet included in the Euro+Med PlantBase and for other names that did not match any valid name or synonym of the Euro+Med PlantBase.

As a baseline for the compilation of diagnostic species groups of individual habitats for the expert system, we took the species lists included in the Habitat descriptions used in the Red List (Janssen et al. 2016). These lists were critically revised based on phytosociological literature, data from our previous report (Schaminée et al. 2016), our personal field experience, and trial analyses of the vegetation plot database used in this project. In connection with this revision, we also selected smaller groups of narrow habitat specialists or typical dominant species, which were used as sociological species groups or total-cover groups.

A database of European trees, shrubs and dwarf shrubs developed for previous projects in 2014–2015 was further extended and revised and other

plant growth forms and life-history types such as hemicryptophytes (perennial herbs), chamaephytes (dwarf shrubs and herbs with above-ground buds) and therophytes (annual plants) were added as a separate species groups and used as sociological species groups or total-cover groups in some definitions.

A total of 76 definitions of 54 habitat types (some habitat types with two definitions) were developed and included in the expert system (Appendix E). The species composition of all 1,288,169 vegetation plots was compared with all the formal definitions. The plots assigned to individual habitats were checked for species composition and mapped, and based on the results, formal definitions were adjusted and errors in the input database corrected. This procedure was repeated several times until an optimal solution was achieved. At the end 289,992 plots were classified as one of the 54 grassland habitat types.

The groups of plots assigned to EUNIS habitat types were used to prepare distribution maps. As some of the coastal dune habitat types could not be separated from the inland sand grasslands based on their species composition, these types were separated using a geographic information system by taking a distance of 500 m from the coast as a division criterion.

3.4 Indicator species of the revised EUNIS grassland habitat types

Three groups of indicator species were defined and extracted for each of the revised EUNIS grassland habitat types based on the groups of vegetation plots assigned to habitat types by the expert system. These groups included diagnostic, constant and dominant species.

It is important to note that diagnostic species were both used as an input to the expert system and created as an output of statistical analysis of groups of vegetation plots classified by this expert system. The input groups of diagnostic species were based on the expert-based compilation of various sources, including the European Red List of Habitats and various phytosociological literature. Consequently, these groups may contain various inconsistencies. The input groups are described in Section 3.2. The output groups were based on the statistical analysis of the classified vegetation plots, which is described in this section. The output groups are more consistent and more reliable. Further development of methods should focus on iterative procedures that would feed back the output groups to the expert system, where they would replace the initial input groups, the updated expert system would be used to reclasify the vegetation-plot data, new output groups would be recalculated based on the new classification, fed back to the expert system and so forth until reaching the convergence between the input and output groups.

An important issue that had to be solved before computing indicator species was the geographical stratification of the vegetation-plot dataset (Knollová et al. 2005). This was needed in order to remove the effect of geographically unbalanced sampling effort across Europe, which meant that some relatively small areas had a high concentration of vegetation plots, while other (often large) areas were represented by few or no plots, even though the habitat type most probably occurs there.

For the purpose of the stratified resampling, the data set was divided into two parts – plots classified as grassland habitat types and plots representing other types. Aquatic vegetation plots and vegetation plots from Greenland, North Africa and Asia east of 60° E were deleted prior to the stratification. Geographical stratification of the classified part of the data set was performed in a grid of 3 x 5 minutes. If a cell of this grid contained more than 1 plot belonging to the same habitat type, one plot was selected randomly and the others were deleted. Geographical stratification of the unclassified part of the data set (plots with geographical coordinates) started with its random division to 10 subsets with equal numbers of plots. Within each subset, one randomly selected plot from each grid cell of 3 x 5 minutes (approximately 5.5 x 6 km at 50° N) was included in the resampled file, while others were deleted. In this way, up to 10 times more unclassified plots were selected from each grid cell, which is justified by the fact that unclassified plots belonged to many habitat types, while for the classified plots selection was always made from a single habitat type. The number of plots in the resampled dataset was much smaller than the total number of plots of these habitats available, but the advantage of this dataset was that it was more representative. Plots of the other types had to be retained in the dataset to provide background for calculating the degree of concentration of species occurrences within the target vegetation type in the computation of diagnostic species.

Diagnostic species were determined based on the degree of concentration of their occurrences in groups of plots representing each EUNIS habitat type. This degree of concentration was calculated using the phi coefficient of association (Sokal & Rohlf 1995) standardized for the identical number of relevés across all groups, which was arbitrarily set to 1% of the total data set (Tichý & Chytrý 2006). The species with a value of phi for the particular habitat higher than 0.15 were considered as diagnostic for this habitat type. However, for some habitat types represented by a low number of plots in the stratified dataset, the concentration of species occurrence within the type may not have been statistically significant. Therefore statistical significance of the species-habitat type association was tested using the Fisher's exact test (Sokal & Rohlf 1995) and if this association was not significant at $P < 0.05$, the species was excluded from the list of diagnostic species (Tichý & Chytrý 2006).

Constant species were defined as those with constancy (= percentage occurrence frequency) in the target habitat type at least 10%.

Dominant species were defined as those that occurred with a cover higher than 25% in at least 5% of vegetation plots classified to the target habitat

type. This means that a species is considered as dominant even if it does not belong to the tallest vegetation layer, and a single plot can have more than one dominant species, or no dominant species if vegetation is very sparse or if cover values of all species are lower than 25%.

Records of species identified only to the genus level were removed from the lists of indicator species. Bryophytes and lichens were included in the calculation of diagnostic, constant and dominant species. However, these taxa were recorded only in some plots, which means that their diagnostic values and values for constancy and dominance are underestimated. It was not possible to calculate these values only for the plots in which they were recorded, because often it was unclear whether their absence in a plot means that they were really absent or they were present but not recorded. Still we list these species with their calculated values at the outputs because they have some information value, though not directly comparable with the values reported for vascular plants.

The resulting lists of indicator species for EUNIS grassland habitat types, including diagnostic, constant and dominant species, are presented in Appendix D.

4 Maps of distribution of the revised EUNIS grassland habitat types

4.1 Background

For policy planning, the distribution of habitat types is an important source of spatial information for assessing the possible effects of human impacts on biodiversity. This includes a wide range of pressures going along with changes in land use (agriculture, urbanisation, etc.) and climate. A phytosociological relevé may reflect the occurrence of a specific habitat type and as such can be seen as a 'pars pro toto' for it. As such, maps of distribution of phytosociological relevés of individual habitat types have their own value, but they also can be used for habitat modelling. Assuming that each habitat type has a specific species composition, responding to specific ecological requirements, correlative estimations of geographic distribution may be generated by analysing patterns in environmental factors such as topsoil pH, solar radiation, annual precipitation and temperature seasonality. In the EEA reports on forest habitats (2013) and heathland, scrub and tundra habitats (2014), such habitat suitability modelling was applied, in the present report on grassland habitats only maps of distribution of phytosociological relevés will be provided. The habitat modelling will be taken care for under another (ETC-Alterra) contract.

4.2 Maps of distribution of phytosociological relevés for each of the revised EUNIS grassland habitat types

The initial dataset used for the analysis was compiled from the EVA database (Chytrý et al. 2016). This data set contained a total of 289,922 grassland vegetation plots of which 243,196 were properly georeferenced (Figure 4.1). The distribution maps are presented in Appendix G, showing the location of the relevés that have been assigned to the EUNIS type concerned and therefore, as indicated above, are used as presence data. The output of the mapping procedure is (to a certain extent) flexible, as different thresholds may be set in applying the expert system. As such, different maps can be produced, e.g. those of the most typical sites and those of all sites, and compared with other habitat maps (see Par. 4.3).

The EUNIS grassland types are in most cases floristically well-defined and therefore relatively few corrections in the distribution had to be made. In total 240 plots have been excluded (located in the sea or otherwise obviously misplaced), which is about 0.1% of the total pool. Some plots located within

500 m from the coast were relocated from other types to coastal B types. For example a number of plots from E1.9a (Oceanic to subcontinental inland sand grassland on dry acid and neutral soils), E1.9b (Inland sanddrift and dune with siliceous grassland), and E1.1a (Pannonian and Pontic sandy steppe) were moved to B1.4a (Atlantic and Baltic coastal dune grassland (grey dune)). It is important to mention that the maps show available plots and not the complete distribution of a habitat type.

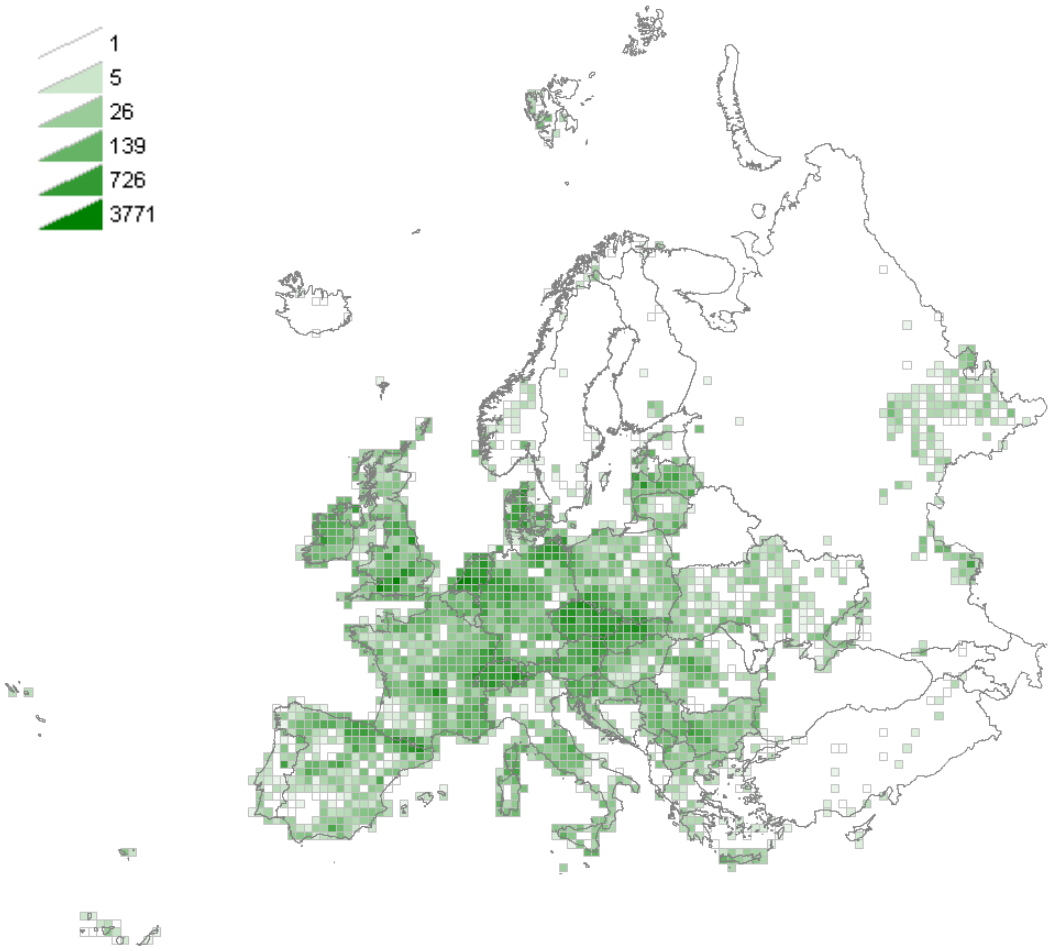

Figure 4.1. Density of all georeferenced grassland plots in EVA in 50 x 50 km grid cells on 6-11-2016 (based on 243,196 plots).

4.3 Comparison of maps

Maps showing the distribution of (*in situ*) vegetation plots are a way of presenting spatial information about habitat types in a well-structured and formalized way. Other maps use a variety of sources of information and therefore may show a different distribution for the same habitat type. For example, Figure 4.2 compares the distribution of the plots assigned to the EUNIS habitat type E2.3 (Mountain hay meadows) with the distribution map produced by the European Red List project for the same habitat. It can be seen that there are no plots shown for United Kingdom and Sweden, although the Red List map shows that the habitat occurs there. Partly this is due to a lack of plot data (particularly for Sweden), but partly also to the role that indicator species play for the habitat identification. The pool of species typical of this habitat in the UK is relatively poor compared to central Europe; many members of the group of indicator species for this habitat type are not present. By lowering the threshold for the required number of species in the expert system, British sites would be shown but at the same time many extra sites would appear in central Europe which may not house this habitat and it furthermore would also suggest that the habitat type is present in the Baltic States. Yet, at the same time, as far as the Red List map is concerned, this habitat does occur in the UK and Sweden via one of the data sources used for the Red List map (Habitats Directive Annex 1 habitat type 6520 Mountain hay meadow, equivalent to the EUNIS E2.3).

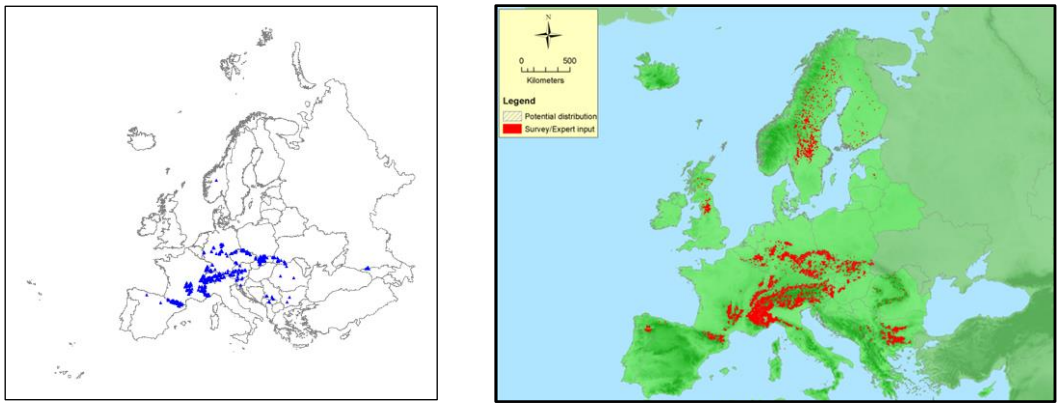

Figure 4.2. Examples of the map of Mountain hay meadows from the EUNIS revision (left, this report) and the European Red List habitat project (right; Janssen et al. 2016).

5 Description in a standard format of the revised EUNIS grassland habitat types

5.1 The existing EUNIS habitat definitions

From the start, the aim of a European habitat classification has been to provide a comprehensive and definitive reference list that is scientific, unambiguous and easily understood (Moss & Roy 1998; Moss 2008). To this end, an integral feature of the EUNIS Habitat Classification is the habitat text descriptions which were incorporated into the underlying database, intended to be accessible as an interface via the EUNIS website portal and available in the hard-copy download of the Classification published as Davies et al. (2004).

Such text descriptions were not at first included for the CORINE Biotopes that were the forerunner of EUNIS, simply English language titles of the habitats (Internal Technical Handbook 1988, partially updated 1989, see Moss & Roy 1998). The later development of the CORINE Biotopes Manual (Devillers et al. 1991) included a descriptive text for each habitat, together with phytosociological and scientific references. When the classification was expanded to the whole Palaearctic, the published version of the classification (Devillers & Devillers Terschuren 1996) did not include text descriptions, simply habitat codes and titles, but in 1995 these were added to the underlying PHYSIS database which had first been released the previous year.

The development of the existing text descriptions in the EUNIS Habitat Classification from earlier versions is detailed in Hill et al. (2004a, 2004b). The text descriptions are variable in length, detail and content: they often include some kind of general statement about the structure of the habitat, many mention particular characteristic species, sometimes highlighting endemic floras, and references to climatic, terrain and soil characteristics vary in detail, often being summarised using broad categories or terms.

There is a glossary appended to the EUNIS Habitats Classification (Davies et al. 2004, since been updated in 2006, version supplied by Doug Evans of the ETC-BD) and this has been derived from various sources. In fact, many of the terms in the Glossary, particularly those with a more specific geographical and topographic reference, are redundant, never figuring in the text descriptions.

5.2 The habitat descriptions of the revised EUNIS grassland types

Since the revision of the EUNIS G Forests (Schaminée et al. 2013) and F Heath, Scrub & Tundra habitats (Schaminée et al. 2014), in which new standardised habitat definitions were provided, the Red List has completed its work. That project has used a habitat typology which has now been adopted for EUNIS and provides a fact sheet for each habitat which includes a full Habitat description and also a Summary.

Although the Summary includes references to the condition of and threats to the habitat, it is primarily concerned to provide a brief description of the vegetation, its relation to climate, soils and biotic factors – particularly human interventions – and its European distribution. In other words, it offers (and for all the EUNIS habitats in the typology) essentially the kind of summary description that has already been prepared in these contracts for G Forests and F Heath, Scrub & Tundra habitats and which were commissioned in this current contract for E Grasslands. Accordingly, with due acknowledgement to the Red List, we have prepared Grassland descriptions which are very similar to the Summaries found there and recommend that, in future EUNIS habitat revisions, there is an explicit adoption of a single standardised format.

These should provide, as accurately, briefly and precisely as possible, the key distinguishing features of the habitat. With details of species composition now available through analysis of constituent relevés or data tables for the alliances of each habitat, there is no need to repeat this information in the description, as was sometimes the case with the original EUNIS descriptions, unless particular species are absolutely definitive. Any detail provided should concisely reflect the variability in the habitat, not its richness or structural complexity because the descriptions are not the place for small essays in ecology or status, particularly where the habitat is more recognisable.

Like the existing EUNIS habitat and Annex I habitat descriptions and the EuroVegChecklist descriptors, the Red List Habitat Summaries sit rather lightly to the questions of explicit standardised terminology and parameter frames; and there are unresolved questions about the compatibility of terms in the various glossaries that are currently applied to the description of habitats. Therefore, for the moment, we use non-technical terms as far as possible to describe terrain, soil types, altitudinal belts; and we use the ETC-BD terminology to refer to the biogeographic zone otherwise avoiding any specialised terminology to describe climatic relationships or broad geographical distribution.

The new descriptions along with the originals are attached as Appendix E EUNIS revision and the European Red List of Habitats.

6 EUNIS revision and the European Red List of Habitats

6.1 Background

Concurrently with the EUNIS Revision process, the Red List has been providing an assessment of endangerment of all European terrestrial, freshwater and marine habitats. Below, we consider how the two strands of enquiry have used the existing EUNIS typology, what is their geographical and ecological scope and what are the elements of the descriptive frames offered by each.

6.2 Habitat typology

The Red List used a modified EUNIS typology as the most appropriate framework for assessment, at level 3 for all terrestrial and freshwater habitats (Janssen et al. 2016). This differed only very slightly from the typology that formed the basis of the earlier EUNIS revisions of G Forests and F Heath, Scrub and Tundra: in the Red List, F9.1a (Arctic, boreal and alpine riparian scrub) and F9.1b (Temperate riparian scrub) were merged into a single F9.1 (Temperate and boreal riparian scrub); and B1.7b (Mediterranean wooded dunes with Quercus spp.) was merged with G2.1 (Mediterranean evergreen Quercus woodland). There were also subsequent changes to habitat names among these and other groups: for example, changing from plural to singular terms in the names of all habitats ('grasslands' to 'grassland') and some other clarifications (such as changing 'waters' to 'water body'). The present relationship between the original EUNIS habitat codes and names and those used in the Red List and EUNIS revision process so far are shown in the crosswalk included as Appendix B.

During the Red List assessment, it became clear that some parts of the modified EUNIS typology were less robust than others and would warrant subsequent revision, sometimes merging of habitats, sometimes splitting, sometimes addition of wholly new types. The assessment process itself allowed assessors to indicate whether they felt sub-habitats could be recognised but the results, though included on the Red List Habitat fact-sheets, are rather uneven, are meant to indicate whether sub-division would result in a different endangerment category and are sometimes influenced by regional enthusiasms.

Since completion of the Red List, further enquiries have been made among the Habitat Working Group leaders and their suggestions are included in column E of the Appendix B spreadsheet. More thorough and detailed

possibilities for revising the typology of C Freshwater habitats have also been produced by Arts & Schaminée (2016) and these too are included there. Further more formal revision is most pressing for C Freshwaters and D Mires, less so for A/B Coastal and H/I Sparsely-vegetated habitats.

6.3 Geographical scope

The EUNIS revision process encompasses habitats across the wider Europe while the Red List was specifically concerned with assessments at the levels of the EU28 and EU28+ (Switzerland, Norway, Iceland and the Balkan countries, see Figure 6.1) and excludes habitats found only beyond these limits such as E1.1f Continental dry rocky steppic grasslands and dwarf scrub on chalk outcrops included here. The Red List also includes benthic marine habitats, although EUNIS A saltmarshes were considered with the B Coastal habitats among the terrestrial types.

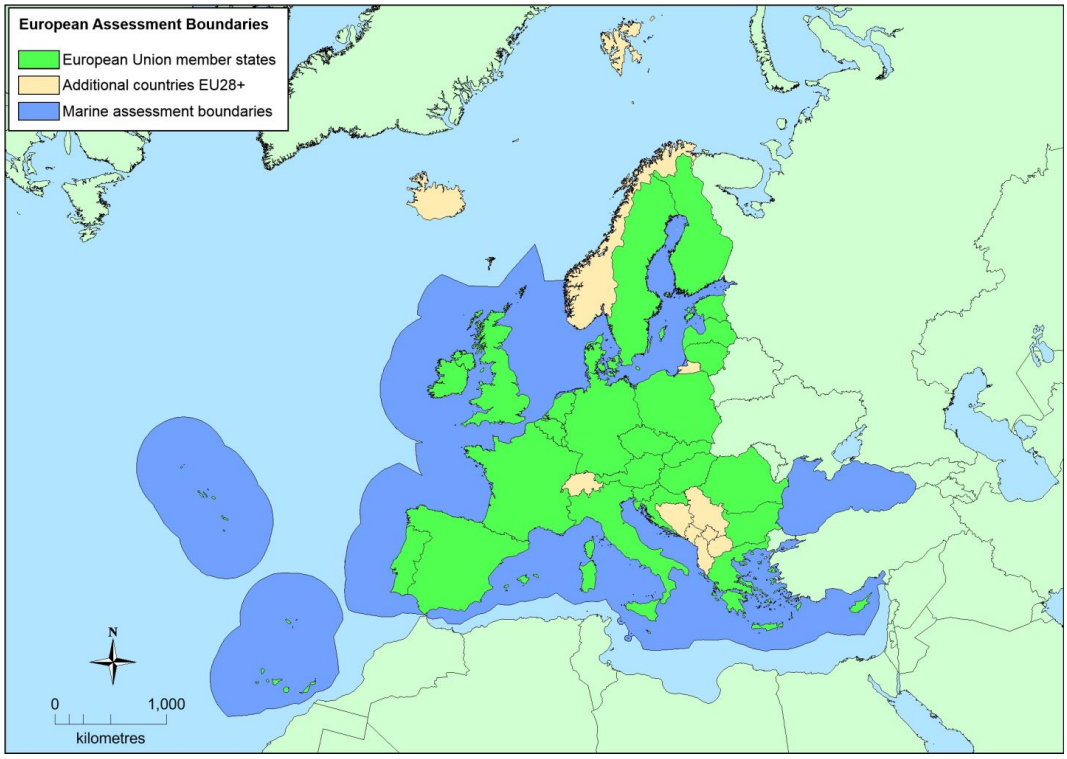

Figure 6.1. Geographical scope of the European Red List of Habitats.

6.4 Ecological scope

Both the EUNIS revision and the Red List exclude habitats considered highly anthropogenic, such as E1.6 Subnitrophilous annual grassland, E1.C Dry mediterranean lands with unpalatable non-vernal herbaceous vegetation, E1.D Unmanaged xeric grassland and E1.E Trampled xeric grasslands with annuals. The Red List also includes a very few mosaics and abiotic habitats of rocks, ice and waters.

6.5 The descriptive frame

Table 6.1 summarises the descriptive information available under different heads and the following text provides detail and highlights compatibilities and differences between the EUNIS Revision process and the Red List.

Descriptor
The EUNIS habitat revision process has included the delivery of brief, more or less standardised descriptions to replace the rather varied style of text appended to the habitat codes and names in Davies et al. (2004) and in the underlying database. After the delivery of such descriptions for the G Woodlands (Schaminée et al. 2014) and F Heath, scrub & Tundra habitats (Schaminée et al. 2015), the Red List began producing a Summary for all habitats in essentially the same format, although also including a brief reference to major threats and current condition. Without these latter details, the Summaries have been used to develop the Descriptions for this revision of the E Grassland habitats and it will now be possible to adapt them as the basis of what are perhaps best termed Descriptors for the remaining EUNIS habitats.

Habitat Description
The Red List used a team of experts to produce detailed Habitat Descriptions to aid recognition of the habitats for the assessment process. These were of a broadly standardised format, providing text information on species composition, vegetation structure, relationships to climate, geology, terrain, soil and biotic influences. Information on associated fauna and cultural resonances was also sometimes included. The Habitat Description provided the basis of the Summary for each habitat. A thorough final scientific and linguistic edit would be necessary before these could be included in any revised EUNIS framework.

Species list
For the EUNIS revision process, an expert system has been devised and refined, using formal definitions to extract vegetation plots, then consistent numerical criteria to identify constant, diagnostic and dominant species, including bryophytes and lichens where the data were available in the relevés. The Red List includes a list of 'characteristic species' selected by experts for each habitat, always vascular plants, sometimes also bryophytes and lichens, rarely fauna, and then usually charismatic animals.

	EUNIS Revision process	European Red List (only terrestrial types)
Geographical scope	All Europe	EU 28 and EU28+ (Switzerland, Norway, Iceland & Balkan countries)
Ecological scope	Excludes extreme anthropogenic habitats and landscape-scale mosaics	Excludes extreme anthropogenic habitats and most landscape-scale mosaics, but includes some abiotic habitats
Descriptor	Habitat description	Summary
Habitat Description		Habitat text description
Species list	List & % of Constant, dominant & diagnostic vascular plants, sometimes bryophytes and lichens (EVA data with expert system & numerical criteria)	List of characteristic vascular plants, often including bryophytes and lichens, rarely fauna (expert opinion)
Indicators of quality		List of particular indicators of quality for the habitat
Images		Two images with brief title
Synonymy	EUNIS (2004) & EuroVegChecklist (2013)	EUNIS (2004), Emerald (2015), EuroVegChecklist (2013), Annex I (2003), MAES (2016), IUCN (2015) & EFT (2007)
Map	Map of point-source data (EVA relevés) & Habitat suitability map (MAXENT modelling) on 1x1 km grid	Map of actual and potential distribution from various sources on 10x10km grid (EVA relevés, GBIF species, Article 17 habitats, VME polygons, national databases, expert opinion)
Extent of Occurrence		Calculated from the map in km^2
Area of Occupancy		Calculated from map as number of 10x10km cells
Pressures & threats		Main threats using Article 17 categories
Conservation & management		Main actions using Article 17 categories
Red List assessment		Using modified IUCN (2013) Criteria & Categories

Table 6.1. Components of the descriptive frames of the EUNIS revision process and the European Red List of Habitats.

Indicators of quality
The Red List includes for each habitat a set of indicators of quality intended to assist in assessing changes in quality over the prescribed historical time periods of approximately 50 and 250 years.

Images
Two high quality images of each habitat are provided in the Red List, illustrating general character and place in the landscape, rather than fine floristic detail, with brief details of location and attribution to owner.

Synonymy
Both EUNIS revision and the Red List provide an audit trail to the original EUNIS typology and, for synonymy with phytosociological alliances, both use the EuroVegChecklist of July 2013, with an assumption that crosswalks can be updated using the upcoming published version of the EuroVegChecklist. Figure 6.2 indicates the variation in numbers of alliances/habitat for all the Red List habitats.

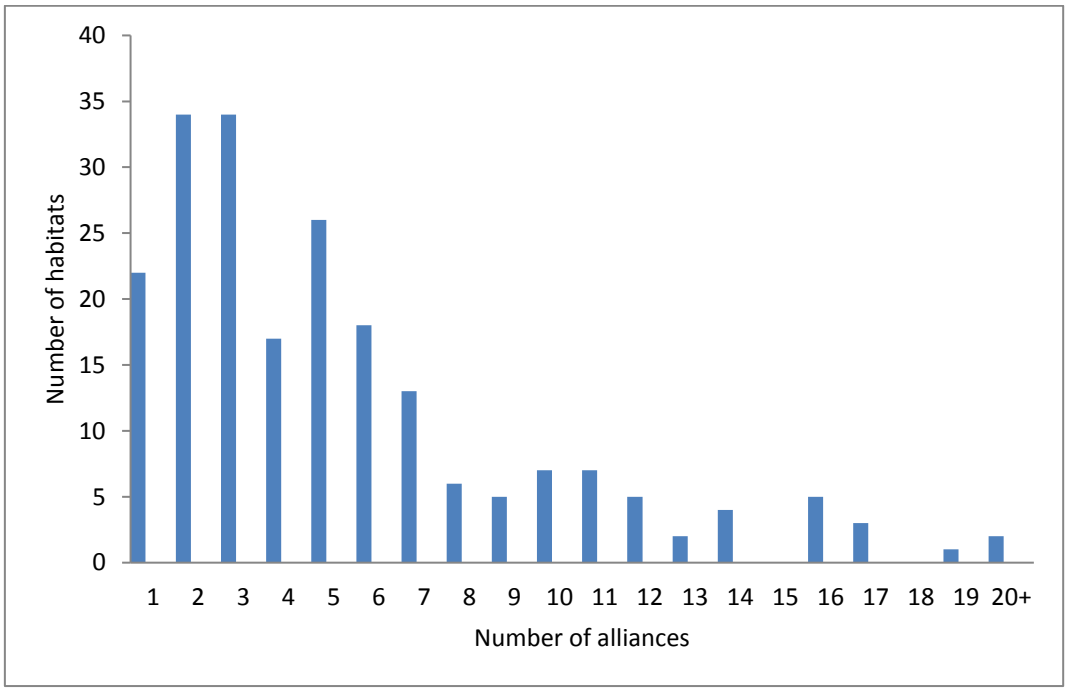

Figure 6.2. Number of EuroVegChecklist 2013 alliances per Red List habitat.

The Red List also includes a synonymy with Emerald, Annex I, MAES, IUCN habitats or ecosystems and any other relevant framework such as, for Forests, the European Forest Types.

Distribution map
Habitat distribution maps for the EUNIS revision process are derived from interrogation of relevés of constituent alliances in EVA, visualised as point sources. In earlier stages of the EUNIS revision, habitat suitability maps were produced using MAXENT modelling but these are now the subject of separate enquiry within ETC/BD-Alterra. EVA data have also been used for the habitat maps in the Red List, along with a number of other sources where appropriate (listed in Table 6.2). Known occurrences of the habitat are shown on a 10x10 km grid in two classes: actual distribution from relatively reliable sources (surveys, expert knowledge), and potential distribution based on models or less reliable indicators. Clicking on a particular grid square within the GIS database reveals the sources for that square. Known but imprecise occurrence within a particular territory is shown by shading the whole.

Number	Description	Code	Reference
1	Distribution maps of Annex I habitat types provided in the 2013 Article 17 report for the Habitat's Directive (covering EU27)	Art17	EEA, Copenhagen
2	European Vegetation Archive (EVA). Dataset of vegetation relevés in Europe, version January 2016.	EVA	Chytrý et al. 2016
3	Distribution of plant and animal species from the GBIF website, version January 2016	GBIF	www.gbif.org
4	Natural Vegetation Map of Europe. Potential natural vegetation. Only used for forest types and other habitats where the potential distribution is likely to be similar to the actual distribution.	BOHN	Bohn et al. 2000/2003

7	Literature and expert knowledge. Only used for habitats with large distribution gaps in the previous sources	EXP, LIT	-

Table 6.2. Data sources for maps in the European Red List of Habitats.

Extent of Occurrence and Area of Occupancy
In the Red List, the distribution maps were used for calculating the Extent of Occurrence as the minimum polygon enclosing all occurrences (in km^2) and Area of Occupancy (number of 10x10km cells) for each habitat.

Territorial distribution
The Red List aimed to provide data on present extent and past extent (approximately 50 years earlier) and, where possible, earlier historical extent (say 250 years earlier) for each habitat in each territory (in km^2). In practice, such data were often based on expert opinion, particularly for earlier extent. These data, together with calculations of the trends in quantity and quality which formed the basis of the Red List assessment, are lodged in an Excel spreadsheet.

Pressures and threats
The Red List indicates the major pressures and threats on each habitat using the framework provided in Article 17 reporting, which was found adequate for the most part. These data were used to provide overall calculations of threats for the major EUNIS-1 habitat groups such as E Grasslands. Text explains the particular impact and importance of the threats for each habitat.

Conservation and management measures
In the Red List, these measures were listed using the Article 17 framework, but this was found to be very inadequate for the purpose. An estimate of the feasibility and time-scale for recovery from damage was provided for each habitat though not included in the assessment calculation.

Red List assessment
For each habitat, a modified version of the IUCN Categories & Criteria for Red List of Ecosystems (2013) was used to provide an overall assessment of level of threat across Europe as a whole. The Habitat factsheet provides full details of the assessment and a Synthesis summarises the assessment category and diagnostic criteria.

6.6 The Red List and Annex 1

The Red List was also charged with comparing the assessments of EUNIS habitats with the Conservation Status ratings of the equivalent Annex I habitats. In fact, such equivalence is complex: few revised EUNIS habitats correspond 1:1 with an Annex I habitat, for others the relationship is 1:many or many:1 or many:many. The results of the comparison were provided as two spreadsheets, organised by EUNIS habitat and by Annex I habitat, but neither these, nor any covering text, have been included in the final Red List publications.

7 Recommendations and future prospects

So far, three major European groups of habitat types have been reviewed: the EUNIS G Forest habitat types in 2013, the F Heathland, scrub and tundra habitat types in 2014, and the E Grassland habitat types in 2016 (together with a few other closely related habitats), based on the crosswalks between the EUNIS habitat classification and the syntaxa of the EuroVegChecklist. An obvious next step (1) would be to analyse further EUNIS habitat groups, such as A/B Coastal habitats, C Freshwater habitats, D Mires & bogs and H/I Sparsely-vegetated habitats. In line with this, the mapping of the distribution of phytosociological relevés and habitat suitability modelling could be extended to these habitat groups, as well as the development of formal definitions for supervised classification and the compilation of lists of indicator species of the habitat types included. Typological complexities and data availability for these habitat groups could suggest a preferred order for considering their analysis.

Two other possible related tasks would include (2) the construction of a roadmap for the final revision of the EUNIS habitat classification, including a gap analysis of the Red List typology with respect to the EUNIS classification and a procedure for defining and documenting missing habitat types, and (3) an update of crosswalks between the revised EUNIS classiciation and the final version of the EuroVegChecklist (December 2016).

Furthermore, the convergence of the EUNIS revision process and the Red List could be pursued, as the completion of the Red List project in June 2016 presents an unparalleled opportunity to combine and harmonise its outputs with those of the EUNIS revision projects, for the enhancement of the EUNIS habitat classification, its scientific meaning and applications, and as a robust basis for more popular dissemination.

In addition to harmonising a common EUNIS habitat typology, the key decisions to consider are (1) how far to combine the results of the EUNIS Revision and the Red List; (2) what are the complementarities and compatibilities in content, quality and format of the data and information in each source; and (3) on what platform any combination might be made.

In Schaminée (2014), it was forseen that the products of the EUNIS revision process would be best incorporated into a revised EUNIS database parameter frame with comprehensive habitat fact sheets accessible through a web portal and with associated formal query routines. Ultimate incorporation of Red List data and information was seen as a key stage in the roadmap for attaining such a goal. These products have been delivered in a variety of specified formats to the EEA for incorporation into the Biodiversity data centre and any combination of material would necessarily involve a technical appraisal of the favoured platform and its suitability for access via a web portal and query routines.

Final editing of the EUNIS habitat descriptions and the Red List habitat summaries and full descriptions, together with the expansion of a EUNIS habitat parameter frame will also necessitate harmonisation of environmental references within a single acceptable glossary.

Tichý, L. & Chytrý, M. (2006). Statistical determination of diagnostic species for site groups of unequal size. *Journal of Vegetation Science* 17: 809–818.

Appendix A: List of the grassland habitat types that are treated in the project, based on the revised EUNIS classication

B1.4a	Atlantic and Baltic coastal dune grasslands (grey dunes)
B1.4b	Mediterranean and Macaronesian coastal dune grasslands (grey dunes)
B1.4c	Black Sea coastal dune grasslands (grey dunes)
E1.1a	Pannonian and Pontic sandy steppe
E1.1b	Temperate and boreal pioneer grassland on shallow soils on siliceous rock outcrops
E1.1d	Submediterranean and temperate pioneer grassland on calcareous and ultramafic rock outcrops
E1.1e	Submediterranean open dry grasslands of skeletal calcareous and ultramafic soils
E1.1f	Continental dry rocky steppic grasslands and dwarf scrub on chalk outcrops
E1.1g	Perennial grassland on rocky outcrops at low altitudes in Central and Southeastern Europe
E1.1h	Submontane to supramontane ultramafic rocky grasslands of the Balkans
E1.1i	Subatlantic and submediterranean perennial grassland on calcareous shallow soils
E1.1j	Dry steppic, submediterranean pastures of Southeastern Europe
E1.2a	Semi-dry perennial calcareous grassland
E1.2b	Continental dry steppe
E1.3a	Mediterranean closely grazed dry grassland
E1.3b	Mediterranean tall perennial dry grassland
E1.3c	Mediterranean annual-rich dry grassland
E1.5a	Iberian oromediterranean siliceous dry grassland
E1.5b	Iberian oromediterranean basiphilous dry grassland
E1.5c	Corsican and Sardinian oromediterranean siliceous dry grassland
E1.5d	Greek and Anatolian oromediterranean siliceous dry grassland
E1.5e	Madeiran oromediterranean siliceous dry grassland
E1.7a	Lowland to submontane, dry to mesic Nardus grassland
E1.8	Open Iberian supramediterranean dry acid and neutral grassland
E1.9a	Oceanic to subcontinental inland sand grassland on dry acid and neutral soils
E1.9b	Inland sanddrifts and dunes with siliceous grasslands
E1.A	Mediterranean to Atlantic open, dry, acid and neutral grassland
E1.B	Heavy-metal grassland
E1.F	Azorean open, dry, acid to neutral grassland
E2.1a	Mesic permanent pastures of lowlands and mountains
E2.2	Low and medium altitude hay meadows
E2.3	Mountain hay meadows
E2.4	Iberian summer pastures (vallicar)
E3.1a	Mediterranean tall humid inland grassland
E3.2a	Mediterranean short moist grassland of lowlands

E3.2b	Mediterranean short moist grassland of mountains
E3.3	Submediterranean moist meadow~~s~~
E3.4a	Moist or wet mesotrophic to eutrophic hay meadow~~s~~
E3.4b	Moist or wet mesotrophic to eutrophic pasture~~s~~
E3.5	Non-Mediterranean moist or wet oligotrophic grassland
E4.1	Vegetated snow-patch
E4.3a	Boreal and arctic acidophilous alpine grassland~~s~~
E4.3b	Temperate acidophilous alpine grassland~~s~~
E4.4a	Arctic-alpine calcareous grassland~~s~~
E4.4b	Alpine and subalpine calcareous grassland~~s~~ of the Balkan and Apennines
E5.2a	Thermophilous woodland fringe~~s~~ of base-rich soils
E5.2b	Thermophilous woodland fringe~~s~~ of acidic soils
E5.2c	Macaronesian thermophilous woodland fringe~~s~~
E5.4	Moist or wet tall-herb and fern fringe~~s~~ of the lowlands
E5.5	Subalpine moist or wet tall-herb and fern stand~~s~~
E6.1	Mediterranean inland salt steppe~~s~~
E6.2	Continental inland salt steppe~~s~~
E6.3	Temperate inland salt marsh

Appendix B: Crosswalk of EUNIS and Red List habitat codes and names with possible further revisions

New EUNIS-3 code	New EUNIS-3 habitat name	Red List code	Red List habitat name	Possible revisions	Original EUNIS-3 code	Original EUNIS-3 habitat name
		A2.5a	Arctic coastal salt marsh		A2.5	Coastal salt marshes and saline reed beds
		A2.5b	Baltic coastal meadow			
		A2.5c	Atlantic coastal salt marsh			
		A2.5d	Mediterranean and Black Sea coastal salt marsh			
		B1.1a	Atlantic, Baltic and Arctic sand beach		B1.1 &	Sand beach driftlines & Sand beaches above the driftline
				Arctic sand beach could be separated from B1.1a		
		B1.1b	Mediterranean and Black Sea sand beach			
		B1.3a	Atlantic and Baltic shifting coastal dune		B1.3	Shifting coastal dunes
		B1.3b	Mediterranean and Black Sea shifting coastal dune			
B1.4a	Atlantic and Baltic coastal dune grassland (grey dunes)	B1.4a	Atlantic and Baltic coastal dune grassland (grey dune)	Could be split into basiphilous and calcifuge types	B1.4	Coastal stable dune grassland
B1.4b	Mediterranean and Macaronesian coastal dune grassland (grey dunes)	B1.4b	Mediterranean and Macaronesian coastal dune grassland (grey dune)			
B1.4c	Black Sea coastal dune grassland (grey dunes)	B1.4c	Black Sea coastal dune grassland (grey dune)			
B1.5a	Atlantic and Baltic coastal Empetrum heath	B1.5a	Atlantic and Baltic coastal Empetrum heath		B1.5	Coastal dune heaths
B1.5b	Atlantic coastal Calluna and Ulex heath	B1.5b	Atlantic coastal Calluna and Ulex heath			
B1.6a	Atlantic and Baltic coastal dune scrub	B1.6a	Atlantic and Baltic coastal dune scrub		B1.6	Coastal dune scrub
B1.6b	Mediterranean and Black Sea coastal dune scrub	B1.6b	Mediterranean and Black Sea coastal dune scrub			
B1.6c	Macaronesian coastal dune scrub	B1.6c	Macaronesian coastal dune scrub			
B1.7a	Atlantic and Baltic broad-leaved coastal dune woodland	B1.7a	Atlantic and Baltic broad-leaved coastal dune woodland		B1.7	Coastal dune woods
B1.7b	Mediterranean wooded dunes with Quercus spp.		former B1.7b merged with G2.1			
B1.7c	Black Sea broad-leaved coastal dune woodland	B1.7b	Black Sea broad-leaved coastal dune woodland			
B1.7d	Baltic coniferous coastal dune woodland	B1.7c	Baltic coniferous coastal dune woodland			
B1.7e	Mediterranean coniferous coastal dune woodland	B1.7d	Mediterranean coniferous coastal dune woodland			
		B1.8a	Atlantic and Baltic moist and wet dune slack		B1.8	Moist and wet dune slacks
		B1.8b	Mediterranean and Black Sea moist and wet dune slack			
B1.9	Machair grassland	B1.9	Machair		B1.9	Machair
		B2.1a	Atlantic, Baltic and Arctic coastal shingle		B2.1-B2.4	Shingle beach driftlines; Unvegetated mobile shingle beaches above the driftline: Upper shingle beaches with open vegetation:
		B2.1b	Mediterranean and Black Sea coastal shingle			
	merged with other F habitats in EUNIS revision		merged with F habitats in Red List		B2.5	Shingle and gravel beaches with scrub
	merged with other G habitats in EUNIS revision		merged with G habitats in Red List		B2.6	Shingle and gravel beach woodland
		B3.1a	Atlantic and Baltic rocky sea cliff and		B3.1-B3.3	Supralittoral rock, Unvegetated rock cliffs, ledges, shores and
		B3.1b	Mediterranean and Black Sea rocky sea cliff and shore			
		B3.1c	Macaronesian rocky sea diff and shore			
				Arctic rocky sea cliff could be added		
		B3.4a	Atlantic and Baltic soft sea cliff		B3.4	Soft sea cliffs, often vegetated
		B3.4b	Mediterranean and Black Sea soft sea cliff			

New EUNIS-3 code	New EUNIS-3 habitat name	Red List code	Red List habitat name	Possible revisions	Original EUNIS-3 code	Original EUNIS-3 habitat name
		C1.1a	Permanent oligotrophic waterbody with very soft-water species	Revision needs to take account of water quality, base-richness and fauna as well as vegetation	C1.1-C1.3	Permanent oligotrophic lakes, ponds and pools; mesotrophic lakes, ponds and pools; permanent eutrophic lakes, ponds and pools
		C1.1b	Permanent oligotrophic to mesotrophic waterbody with soft-water species			
		C1.2a	Permanent oligotrophic to			
		C1.2b	Mesotrophic to eutrophic waterbody with angiosperms			
		C1.4	Permanent dystrophic waterbody		C1.4	Permanent dystrophic waters
		C1.5	Permanent inland saline and brackish waterbody		C1.5	Permanent inland saline and brackish waters
		C1.6a	Temperate temporary waterbody		C1.6	Temporary lakes, ponds and pools
		C1.6b	Mediterranean temporary waterbody	Isoetes-dominated type could be separated		
				New habitat needed for alpine lakes with submerged bryophytes & algae		
		C1.7	Permanent lake of glaciers and ice sheets		C1.7	Permanent lakes of glaciers and ice sheets
		C2.1a	Base-poor spring and spring brook		C2.1	Springs, spring brooks and geysers
		C2.1b	Calcareous spring and spring brook			
				New habitat needed for hot water springs		
		C2.2a	Permanent non-tidal, fast, turbulent watercourse of montane to alpine regions with mosses		C2.2	Permanent non-tidal, fast, turbulent watercourses
		C2.2b	Permanent non-tidal, fast, turbulent watercourse of plains and mountane regions with Ranunculus spp.			
				New habitat needed for middle-altitude rivers		
		C2.3	Permanent non-tidal, smooth-flowing watercourse	Could be split into upper, middle and lower river sections	C2.3	Permanent non-tidal, smooth-flowing watercourses
		C2.4	Tidal river, upstream from the estuary		C2.4	Tidal rivers, upstream from the estuary
		C2.5a	Temperate temporary running watercourse		C2.5	Temporary running waters
			merged with H types		C2.6	Films of water flowing over rocky watercourse margins
			merged with C5.1a, C5.1b		C3.1	Species-rich helophyte beds
			merged with C5.1a		C3.2	Water-fringing reedbeds and tall helophytes other than canes
			C3.3 omitted from Red List as intensively anthropogenic		C3.3	Water-fringing beds of tall canes
			merged with other habitats (C3.5, C5.1b) in Red List		C3.4	Species-poor beds of low-growing water-fringing or amphibious vegetation
		C3.5a	Periodically exposed shore with stable, eutrophic sediments with pioneer or ephemeral vegetation		C3.5	Periodically inundated shores with pioneer and ephemeral vegetation
		C3.5b	Periodically exposed shore with stable, mesotrophic sediments with pioneer or ephemeral vegetation			
		C3.5c	Periodically exposed saline shore-with pioneer or ephemeral vegetation			
		C3.5d	Unvegetated or sparsely vegetated shore with mobile sediments in montane and alpine regions			
		C3.5e	Unvegetated or sparsely vegetated shore with mobile sediments in the Mediterranean region			
			Merged with H-types, including H3.4		C3.8	Inland spray- and steam-dependent habitats
		C5.1a	Tall-helophyte bed	Coastal and estuarine types could be separated	D5.1	Helophyte dominated freshwater vegetation
		C5.1b	Small-helophyte bed			
		C5.2	Tall-sedge bed		D5.2	Large sedge dominated freshwater vegetation and meadows
			C5.3 omitted from Red List as intensively anthropogenic		D5.3	Swamps and marshes dominanted by Juncus effusus and other large Juncus spp.
		C5.4	Inland saline or brackish helophyte bed		D6.2	Inland saline or brackish species-poor helophyte beds
		C6.1	Underground standing and running waterbody		H1.5	Underground standing water bodies
					H1.6	Underground running water bodies

New EUNIS-3 code	New EUNIS-3 habitat name	Red List code	Red List habitat name	Possible revisions	Original EUNIS-3 code	Original EUNIS-3 habitat name
		D1.1	Raised bog		D1.1	Raised bogs
		D1.2	Blanket bog		D1.2	Blanket bogs
		D2.1	Oceanic valley bog		D2.1	Valley mires
		D2.2a	Poor fen		D2.2	Poor fens and soft-water spring mires
		D2.2b	Relict mire of mediterranean mountains			
		D2.2c	Intermediate fen and soft water spring mire			
		D2.3a	Non-calcareous quaking mire		D2.3	Transition mirtes and quaking bogs
		D3.1	Palsa mire	Seasonally-frozen pounikko mire could be separated	D3.1	Palsa mires
		D3.2	Aapa mire	Northern boreal/subarctic type with distinctive fauna in pools could be distinguished	D3.2	Aapa mires
			D3.3 omitted from Red List as beyond geographic limit		D3.3	Polygon mires
		D4.1a	Small-sedge base-rich fen and calcareous spring mire	Could be split into Travertine Carpathian, Temperate mountain & Atlantic dune-slack fens	D4.1	Rich fens, including eutrophic tall-herb fens and calcareous flushes and soaks
		D4.1b	Tall-sedge base-rich fen			
		D4.1c	Calcareous quaking mire			
		D4.2	Arctic-alpine rich fen		D4.2	Basic mountain flushes and streamsides, with a rich arctic-montane flora
			Moved in Red List to C		D5.1	Helophyte dominated freshwater vegetation
			Moved in Red List to C			
			Moved in Red List to C		D5.2	Large sedge dominated freshwater vegetation and meadows
			Moved in Red List to C; not assessed under the Red List of Habitats (largely anthropogenic)		D5.3	Swamps and marshes dominanted by Juncus effusus and other large Juncus spp.
			Moved in Red List to E		D6.1	Inland saltmarshes
			Moved in Red List to C		D6.2	Inland saline or brackish species-poor helophyte beds

New EUNIS-3 code	New EUNIS-3 habitat name	Red List code	Red List habitat name	Possible revisions	Original EUNIS-3 code	Original EUNIS-3 habitat name
E1.1a	Pannonian and Pontic sandy steppe	E1.1a	Pannonian and Pontic sandy steppe		E1.1	Inland sand and rock with open vegetation
E1.1b	Temperate and boreal pioneer grassland on shallow soils on siliceous rock outcrops	E1.1b	Cryptogam- and annual-dominated vegetation on siliceous rock outcrops			
E1.1c	Boreal open, sub-thermophilous grassland on shallow soils on siliceous rock outcrops		E1.1c merged with E1.1b			
E1.1d	Submediterranean and temperate pioneer grassland on calcareous and ultramafic rock outcrops	E1.1d	Cryptogam- and annual-dominated vegetation on calcareous and ultramafic rock outcrops			
E1.1e	Submediterranean xeric open grassland of skeletal calcareous and ultramafic soils	E1.1e	Perennial rocky grassland of the Italian peninsula			
E1.1f	Continental dry rocky steppic grasslands and dwarf scrub on chalk outcrops		E1.1f omitted from Red List as beyond geographic limit			
E1.1g	Perennial grassland on rocky outcrops at low altitudes in Central and Southeastern Europe	E1.1g	Perennial rocky grassland of Central Europe and the Carpathians			
E1.1h	Submontane to supramontane ultramafic rocky grassland of the Balkans	E1.1h	Heavy-metal dry grassland of the Balkans			
E1.1i	Subatlantic and submediterranean perennial grassland on calcareous shallow soils	E1.1i	Perennial rocky calcareous grassland of subatlantic-submediterranean Europe			
E1.1j	Dry steppic, submediterranean pasture of Southeastern Europe	E1.1j	Dry steppic, submediterranean pasture of South-Eastern Europe			
E1.2a	Semi-dry perennial calcareous grassland	E1.2a	Semi-dry perennial calcareous grassland		E1.2	Perennial calcareous grassland and basic steppes
E1.2b	Continental dry steppe	E1.2b	Continental dry steppe			
E1.3a	Mediterranean closely grazed dry grassland	E1.3a	Mediterranean closely grazed dry grassland		E1.3	Mediterraenan xeric grassland
E1.3b	Mediterranean tall perennial dry grassland	E1.3b	Mediterranean tall perennial dry grassland			
E1.3c	Mediterranean annual-rich dry grassland	E1.3c	Mediterranean annual-rich dry grassland			
	merged with other habitats in EUNIS revision		E1.4 was merged with other habitats in Red List	Is this really separable from E1.3?	E1.4	Mediterranean tallgrass and Artemisia steppes
E1.5a	Iberian oromediterranean siliceous dry grassland	E1.5a	Iberian oromediterranean siliceous dry grassland	Some further differentiation is needed to recognise distinctive serpentine forms.	E1.5	Mediterranean montane grassland
E1.5b	Iberian oromediterranean basiphilous dry grassland	E1.5b	Iberian oromediterranean basiphilous dry grassland			
E1.5c	Corsican oromediterranean siliceous dry grassland	E1.5c	Cyrno-Sardean oromediterranean siliceous dry grassland			
E1.5d	Greek and Anatolian oromediterranean siliceous dry grassland	E1.5d	Greek and Anatolian oromediterranean siliceous dry grassland			
E1.5e	Madeiran oromediterranean siliceous dry grassland	E1.5e	Madeiran oromediterranean siliceous dry grassland			
E1.6	Subnitrophilous annual grasslands		E1.6 was omitted from Red List as intensively anthropogenic		E1.6	Subnitrophilous annual grasslands
E1.7a	Lowland to submontane, dry to mesic Nardus grassland	E1.7	Lowland to submontane, dry to mesic Nardus grassland		E1.7	Non-Mediterranean dry acid and neutral closed grassland
E1.8	Open Iberian supra-mediterranean dry acid and neutral grassland	E1.8	Open Iberian supramediterranean dry acid and neutral grassland		E1.8	Mediterranean dry acid and neutral closed grassland
E1.9a	Oceanic to subcontinental inland sand grassland on dry acid and neutral soils	E1.9a	Oceanic to subcontinental inland sand grassland on dry acid and neutral soils		E1.9	Non-Mediterranean dry acid and neutral open grassland, including inland dune grassland
E1.9b	Inland sanddrifts and dunes with siliceous grassland	E1.9b	Inland sanddrift and dune with siliceous grassland			
E1.A	Mediterranean to Atlantic open, dry, acid and neutral grassland	E1.A	Mediterranean to Atlantic open, dry, acid and neutral grassland		E1.A	Mediterranean dry acid and neutral open grassland
E1.B	Heavy-metal grassland	E1.B	Heavy-metal grassland in Western and Central Europe		E1.B	Heavy-metal grassland
E1.C	Dry Mediterranean lands with unpalatable non-vernal herbaceous vegetation		E1.C was omitted from Red List as intensively anthropogenic	Further thought is needed about omitting anthropogenic grasslands particularly as boundaries with these are often indistinct.	E1.C	Dry mediterranean lands with unpalatable non-vernal herbaceous vegetation
E1.D	Unmanaged dry grassland		E1.D was omitted from Red List as intensively anthropogenic		E1.D	Unmanaged xeric grassland
E1.E	Trampled dry grassland with annuals		E1.E was omitted from Red List as intensively anthropogenic		E1.E	Trampled xeric grasslands with annuals
E1.F	Azorean open, dry, acid to neutral grassland	E1.F	Azorean open, dry, acid to neutral grassland			
E2.1a	Mesic permanent pasture of lowlands and mountains	E2.1a	Mesic permanent pasture of lowlands and mountains		E2.1	Permenant mesotrophic pastures and aftermath-grazed meadows
E2.2	Low and medium altitude hay meadow	E2.2	Low and medium altitude hay meadow		E2.2	Low and medium altitude hay meadows
E2.3	Mountain hay meadow	E2.3	Mountain hay meadow		E2.3	Mountain hay meadows
E2.4	Iberian summer pastures (vallicar)	E2.4	Iberian summer pasture (vallicar)		E2.4	Iberian summer pastures (vallicares)
	merged with other habitats in EUNIS revision		E2.5 was omitted from Red List and divided into other types		E2.5	Meadows of the steppe zone

New EUNIS-3 code	New EUNIS-3 habitat name	Red List code	Red List habitat name	Possible revisions	Original EUNIS-3 code	Original EUNIS-3 habitat name
E3.1a	Mediterranean tall humid inland grassland	E3.1a	Mediterranean tall humid inland grassland		E3.1	Mediterranean tall humid grassland
E3.2a	Mediterranean short moist grassland of lowlands	E3.2a	Mediterranean short moist grassland of lowlands		E3.2	Mediterranean short humid grassland
E3.2b	Mediterranean short moist grassland of mountains	E3.2b	Mediterranean short moist grassland of mountains			
E3.3	Submediterranean moist meadow	E3.3	Submediterranean moist meadow		E3.3	Sub-mediterranean humid meadows
E3.4a	Moist or wet mesotrophic to eutrophic hay meadow	E3.4a	Moist or wet mesotrophic to eutrophic hay meadow	Could be split into temperate/boreal and mediterranean types.	E3.4	Moist or wet mesotrophic to eutrophic grassland
E3.4b	Moist or wet mesotrophic to eutrophic pasture	E3.4b	Moist or wet mesotrophic to eutrophic pasture			
E3.5	Non-Mediterranean moist or wet oligotrophic grassland	E3.5	Temperate and boreal moist or wet oligotrophic grassland		E3.5	Moist or wet oligotrophic grassland
E4.1	Vegetated snow-patch	E4.1	Vegetated snow patch		E4.1	Vegetated snow-patch
E4.2	Moved in EUNIS revision to H		Moved in Red List to H		E4.2	Moss and lichen dominated mountain summits, ridges and exposed slopes
E4.3a	Boreal and arctic acidophilous alpine grassland	E4.3a	Boreal and arctic acidophilous alpine grassland		E4.3	Acid alpine and subalpine grassland
E4.3b	Temperate acidophilous alpine grassland	E4.3b	Temperate acidophilous alpine grassland			
E4.4a	Arctic-alpine calcareous grassland	E4.4a	Arctic-alpine calcareous grassland		E4.4	Calcareous alpine and subalpine grassland
E4.4b	Alpine and subalpine calcareous grassland of the Balkan and Apennines	E4.4b	Alpine and subalpine calcareous grassland of the Balkans and Apennines			
E5.2a	Thermophilous woodland fringe of base-rich soils	E5.2a	Thermophilous woodland fringe of base-rich soils		E5.2	Thermophile woodland fringes
E5.2b	Thermophilous woodland fringe of acidic soils	E5.2b	Thermophilous woodland fringe of acidic soils			
E5.2c	Macaronesian thermophilous woodland fringe	E5.2c	Macaronesian thermophilous woodland fringe			
E5.3	Pteridium aquilinum stand	E5.3	Pteridium aquilinum stand		E5.3	Pteridium aquilinum fields
E5.4	Moist or wet tall-herb and fern fringe of the lowlands	E5.4	Lowland moist or wet tall-herb and fern fringe		E5.4	Moist or wet tall-herb and fern fringes and meadows
E5.5	Subalpine moist or wet tall-herb and fern stand	E5.5	Subalpine moist or wet tall-herb and fern fringe		E5.5	Subalpine moist or wet tall-herb and fern stands
E6.1	Mediterranean inland salt steppe	E6.1	Mediterranean inland salt steppe		E6.1	Mediterranean inland salt steppes
E6.2	Continental inland salt steppe	E6.2	Continental inland salt steppe		E6.2	Continental inland salt steppes
E6.3	Temperate inland salt marsh	E6.3	Temperate inland salt marsh		D6.1	Inland saltmarshes
E7.1	Temperate and hemi-boreal wooded pasture and meadow	E7.1	Temperate wooded pasture and meadow		E7.1	Atlantic parkland
E7.2	Hemi-boreal and Boreal wooded pasture and meadow	E7.2	Hemiboreal and boreal wooded pasture and meadow		E7.2	Sub-continental parkland
E7.3	Mediterranean wooded pasture and meadow	E7.3	Mediterranean wooded pasture and meadow		E7.3	Dehesa

Appendix D: Lists of indicator species of the revised EUNIS grassland habitat types

B1.4a - Atlantic and Baltic coastal dune grassland (grey dune)

*Diagnostic species (phi coefficient * 100)*

Dianthus hyssopifolius subsp. gallicus	48.3	Calystegia soldanella	46.8
Helichrysum stoechas	46.0	Euphorbia portlandica	39.9
Koeleria glauca	37.6	Galium arenarium	32.8
Eryngium maritimum	32.6	Malcolmia littorea	30.2
Euphorbia paralias	30.0	Reichardia gaditana	29.9
Festuca juncifolia	29.0	Herniaria maritima	28.8
Thymus carnosus	27.4	Crucianella maritima	27.1
Ammophila arenaria	26.5	Herniaria ciliolata subsp. robusta	26.3
Carpobrotus edulis	25.0	Mibora minima	25.0
Cerastium diffusum	23.8	Leontodon saxatilis	23.2
Tortula ruraliformis	23.2	Anchusa calcarea	22.1
Linaria supina	21.9	Lagurus ovatus	21.0
Carex arenaria	19.8	Festuca vasconcensis	19.8
Phleum arenarium	19.3	Calendula suffruticosa subsp. algarbiensis	19.2
Armeria pungens	18.4	Pancratium maritimum	18.0
Omphalodes littoralis	17.6	Anagallis monelli	16.7
Armeria welwitschii	15.5	Helichrysum italicum	15.4

Constant species (occurrence frequencies)

Calystegia soldanella	43.0	Helichrysum stoechas	43.0
Ammophila arenaria	41.0	Eryngium maritimum	40.0
Carex arenaria	39.0	Koeleria glauca	39.0
Leontodon saxatilis	38.0	Plantago lanceolata	28.0
Crucianella maritima	26.0	Euphorbia paralias	26.0
Sedum acre	25.0	Dianthus hyssopifolius subsp. gallicus	24.0
Festuca rubra	23.0	Euphorbia portlandica	22.0
Pancratium maritimum	22.0	Lagurus ovatus	20.0
Phleum arenarium	20.0	Artemisia campestris	19.0
Ononis spinosa	19.0	Cerastium diffusum	17.0
Elytrigia juncea	16.0	Malcolmia littorea	16.0
Eryngium campestre	14.0	Polygala vulgaris	14.0
Asperula cynanchica	13.0	Corynephorus canescens	13.0
Helichrysum italicum	13.0	Mibora minima	13.0
Ononis natrix	12.0	Galium arenarium	11.0
Tortula ruraliformis	11.0		

Dominant species (percentage frequencies of occurrences with cover > 25%)

Helichrysum stoechas	29.0	Ammophila arenaria	7.0
Crucianella maritima	7.0	Tortula ruraliformis	6.0
Koeleria glauca	5.0		

B1.4b - Mediterranean and Macaronesian coastal dune grassland (grey dune)

*Diagnostic species (phi coefficient * 100)*

Pancratium maritimum	63.8	Elytrigia juncea	57.8
Medicago marina	53.8	Lotus cytisoides	51.7
Echinophora spinosa	51.1	Silene niceensis	48.4
Eryngium maritimum	46.5	Sporobolus pungens	46.2
Crucianella maritima	45.3	Cyperus capitatus	43.3
Euphorbia terracina	39.5	Silene succulenta	39.4
Anthemis maritima	39.2	Achillea maritima	38.9
Launaea fragilis	38.4	Lotus creticus	38.2
Pseudorlaya pumila	36.9	Cakile maritima	35.4
Cutandia maritima	35.3	Vulpia fasciculata	35.3
Ononis variegata	34.1	Medicago littoralis	34.0
Euphorbia paralias	33.8	Matthiola sinuata	33.3
Silene colorata	32.7	Lagurus ovatus	32.3
Centaurea sphaerocephala	30.2	Malcolmia ramosissima	28.4
Erodium laciniatum	26.9	Helichrysum italicum	26.8
Pycnocomon rutifolium	26.8	Ammophila arenaria	26.6
Calystegia soldanella	26.3	Sonchus bulbosus	26.0
Silene sericea	23.4	Scrophularia ramosissima	22.9
Cutandia divaricata	22.4	Anisantha rigida	21.8
Scolymus hispanicus	21.8	Armeria pungens	21.4
Senecio leucanthemifolius	21.0	Matthiola tricuspidata	20.7
Lobularia maritima	19.9	Ononis diffusa	19.7
Rumex bucephalophorus	19.0	Maresia nana	16.8
Echium humile	16.7	Corynephorus divaricatus	16.6
Senecio glaucus	16.4	Polycarpon tetraphyllum subsp. diphyllum	15.9
Senecio glaucus subsp. coronopifolius	15.8	Glaucium flavum	15.7
Catapodium marinum	15.5	Ononis natrix	15.5
Polygonum maritimum	15.4		

Constant species (occurrence frequencies)

Pancratium maritimum	49.0	Elytrigia juncea	47.0
Eryngium maritimum	38.0	Ammophila arenaria	34.0
Medicago marina	34.0	Lotus cytisoides	29.0
Crucianella maritima	28.0	Echinophora spinosa	27.0
Cyperus capitatus	24.0	Silene niceensis	24.0
Sporobolus pungens	22.0	Lagurus ovatus	21.0
Euphorbia paralias	19.0	Vulpia fasciculata	19.0
Lotus creticus	18.0	Achillea maritima	17.0
Helichrysum italicum	17.0	Medicago littoralis	17.0
Anthemis maritima	16.0	Euphorbia terracina	16.0
Silene succulenta	16.0	Cakile maritima	15.0
Calystegia soldanella	15.0	Launaea fragilis	15.0
Pseudorlaya pumila	15.0	Cutandia maritima	13.0

Silene colorata	13.0	Matthiola sinuata	12.0
Ononis variegata	12.0	Rumex bucephalophorus	12.0
Sonchus bulbosus	12.0	Ononis natrix	11.0

Dominant species (percentage frequencies of occurrences with cover > 25%)

Crucianella maritima	11.0	Ammophila arenaria	10.0
Elytrigia juncea	9.0		

B1.4c - Black Sea coastal dune grassland (grey dune)

*Diagnostic species (phi coefficient * 100)*

Carex colchica	58.3	Secale sylvestre	57.9
Centaurea arenaria	56.2	Leymus racemosus	53.7
Silene thymifolia	50.0	Jurinea kilaea	49.4
Lepidotrichum uechtritzianum	46.4	Odontarrhena borzaeana	37.5
Alyssum hirsutum	36.2	Cionura erecta	34.7
Lomelosia ucranica	33.4	Linaria genistifolia	32.7
Silene euxina	32.5	Syrenia montana	32.0
Peucedanum arenarium	31.0	Cynanchum acutum	30.8
Astragalus varius	29.3	Ephedra distachya	29.2
Verbascum purpureum	28.9	Crambe maritima	28.1
Stachys atherocalyx	28.0	Euphorbia seguieriana	27.5
Festuca beckeri	27.3	Seseli tortuosum	26.4
Jasione heldreichii	25.9	Astrodaucus littoralis	25.1
Verbascum pinnatifidum	24.8	Anisantha tectorum	24.6
Corispermum nitidum	23.4	Scabiosa argentea	22.6
Centaurea scabiosa subsp. adpressa	22.3	Festuca arenicola	22.3
Gypsophila perfoliata	22.1	Asperula setulosa	20.1
Eryngium maritimum	19.9	Alyssum minutum	19.7
Teucrium polium	18.4	Galium humifusum	18.3
Tribulus terrestris	18.2	Silene subconica	17.9
Stipa borysthenica	17.9	Artemisia campestris	17.7
Lactuca tatarica	17.7	Thymus dimorphus	17.5
Elymus uralensis subsp. viridiglumis	17.4	Chondrilla juncea	17.3
Polygonum arenarium	16.4	Anchusa leptophylla	16.2
Salsola tragus	16.1	Marrubium peregrinum	15.9
Plantago arenaria	15.9	Alyssum turkestanicum	15.6
Jurinea longifolia	15.6	Agropyron dasyanthum	15.4
Asperula graveolens	15.4	Tragopogon brevirostris subsp. brevirostris	15.4

Constant species (occurrence frequencies)

Carex colchica	46.0	Centaurea arenaria	43.0
Secale sylvestre	43.0	Artemisia campestris	40.0
Euphorbia seguieriana	32.0	Leymus racemosus	31.0
Linaria genistifolia	31.0	Medicago falcata	26.0
Jurinea kilaea	25.0	Silene thymifolia	25.0
Eryngium maritimum	24.0	Anisantha tectorum	23.0

Lepidotrichum uechtritzianum	22.0	Chondrilla juncea	20.0
Ephedra distachya	20.0	Seseli tortuosum	20.0
Teucrium polium	20.0	Syntrichia ruralis	18.0
Alyssum hirsutum	17.0	Festuca beckeri	16.0
Odontarrhena borzaeana	16.0	Ammophila arenaria	15.0
Astragalus onobrychis	14.0	Cynanchum acutum	14.0
Cynodon dactylon	14.0	Cionura erecta	13.0
Cyperus capitatus	13.0	Poa bulbosa	13.0
Scabiosa argentea	13.0	Astragalus varius	12.0
Cladonia foliacea	12.0	Peucedanum arenarium	12.0
Syrenia montana	12.0	Erysimum diffusum	11.0
Lomelosia ucranica	11.0	Scirpoides holoschoenus	11.0
Silene euxina	11.0		

Dominant species (percentage frequencies of occurrences with cover > 25%)

Carex colchica	11.0	Artemisia campestris	7.0
Ephedra distachya	6.0		

E1.1a - Pannonian and Pontic sandy steppe

*Diagnostic species (phi coefficient * 100)*

Koeleria glauca	49.3	Festuca vaginata	45.6
Bassia laniflora	42.5	Festuca beckeri	41.7
Polygonum arenarium	41.2	Euphorbia seguieriana	38.4
Stipa borysthenica	36.4	Silene borysthenica	32.6
Syrenia cana	31.8	Centaurea arenaria	29.7
Festuca psammophila	29.0	Festuca polesica	28.9
Helichrysum arenarium	28.7	Secale sylvestre	28.2
Achillea micrantha	27.9	Thymus pallasianus	27.1
Asperula graveolens	26.7	Gypsophila paniculata	26.2
Jurinea cyanoides	25.5	Jacobaea borysthenica	25.3
Artemisia campestris	24.5	Dianthus platyodon	23.5
Dianthus arenarius	22.2	Agropyron dasyanthum	22.1
Tragopogon floccosus	21.8	Odontarrhena tortuosa	21.0
Tragopogon ucrainicus	20.7	Jurinea longifolia	20.5
Veronica dillenii	20.3	Syntrichia ruralis	19.9
Alyssum minutum	19.5	Carex colchica	19.3
Minuartia glomerata	19.3	Astragalus varius	19.2
Anchusa gmelinii	19.1	Centaurea breviceps	19.0
Tragopogon borysthenicus	18.5	Jurinea polyclonos	17.7
Herniaria polygama	17.6	Chondrilla juncea	16.6
Dianthus serotinus	16.5	Tragopogon brevirostris subsp. brevirostris	16.2
Corispermum nitidum	15.9	Dianthus borbasii	15.9
Minuartia viscosa	15.6	Scabiosa ucranica	15.6
Alyssum montanum	15.2	Cladonia polycarpoides	15.2
Silene otites aggr.	15.2		

Constant species (occurrence frequencies)

Artemisia campestris	54.0	Koeleria glauca	49.0
Euphorbia seguieriana	43.0	Helichrysum arenarium	30.0
Syntrichia ruralis	27.0	Festuca vaginata	25.0
Bassia laniflora	24.0	Poa bulbosa	24.0
Festuca beckeri	23.0	Ceratodon purpureus	22.0
Polygonum arenarium	21.0	Cerastium semidecandrum	20.0
Cladonia foliacea	20.0	Silene otites aggr.	20.0
Chondrilla juncea	19.0	Corynephorus canescens	19.0

Eryngium campestre	11.0	Fumana procumbens	11.0
Gypsophila paniculata	11.0	Jasione montana	11.0

Dominant species (percentage frequencies of occurrences with cover > 25%)

Festuca polesica	8.0	Festuca psammophila	8.0
Festuca vaginata	8.0	Festuca beckeri	7.0
Syntrichia ruralis	6.0		

E1.1b - Cryptogam- and annual-dominated vegetation on siliceous rock outcrops

*Diagnostic species (phi coefficient * 100)*

Scleranthus perennis	33.5	Polytrichum piliferum	32.4
Sedum rupestre	21.5	Sedum album	20.2
Veronica dillenii	19.7	Racomitrium canescens	19.5
Gagea bohemica	18.8	Cladonia foliacea	17.7
Ceratodon purpureus	16.5	Erophila verna	15.7

Constant species (occurrence frequencies)

Polytrichum piliferum	49.0	Rumex acetosella	40.0
Scleranthus perennis	38.0	Ceratodon purpureus	32.0
Pilosella officinarum	31.0	Sedum album	31.0
Trifolium arvense	30.0	Erophila verna	26.0
Sedum acre	26.0	Sedum rupestre	26.0
Festuca ovina	25.0	Jasione montana	25.0
Cladonia foliacea	24.0	Poa bulbosa	24.0

Artemisia campestris	22.0	Arenaria serpyllifolia	20.0
Potentilla argentea	20.0	Potentilla tabernaemontani	20.0
Hypnum cupressiforme	19.0	Plantago lanceolata	18.0
Veronica arvensis	18.0	Aira caryophyllea	17.0
Corynephorus canescens	17.0	Racomitrium canescens	17.0
Hypochaeris radicata	16.0	Veronica dillenii	16.0
Agrostis capillaris	15.0	Erodium cicutarium	15.0
Euphorbia cyparissias	15.0	Hypericum perforatum	15.0
Myosotis stricta	15.0	Cerastium semidecandrum	14.0
Cladonia furcata	14.0	Sedum sexangulare	14.0
Achillea millefolium	13.0	Cerastium pumilum	13.0
Echium vulgare	13.0	Thymus praecox	13.0
Cladonia rangiformis	12.0	Sanguisorba minor	12.0
Teesdalia nudicaulis	12.0	Thymus pulegioides	12.0
Veronica verna	12.0	Agrostis vinealis	11.0
Centaurea stoebe	11.0	Scleranthus annuus aggr.	11.0
Syntrichia ruralis	11.0		

Dominant species (percentage frequencies of occurrences with cover > 25%)

Polytrichum piliferum	19.0	Sedum album	10.0
Racomitrium canescens	7.0		

E1.1d - Cryptogam- and annual-dominated vegetation on calcareous and ultramafic rock outcrops

*Diagnostic species (phi coefficient * 100)*

Sedum album	34.6	Saxifraga tridactylites	33.4
Erophila verna	25.4	Hornungia petraea	25.1
Arenaria serpyllifolia	21.7	Clinopodium acinos	20.8
Sedum acre	20.2	Encalypta vulgaris	18.5
Minuartia hybrida	18.5	Medicago minima aggr.	18.0
Alyssum alyssoides	17.8	Cladonia symphycarpa	17.7
Tortella inclinata	17.4	Cerastium pumilum	17.3
Barbula convoluta	17.0	Homalothecium sericeum	16.3

Constant species (occurrence frequencies)

Sedum album	51.0	Arenaria serpyllifolia	48.0
Sedum acre	43.0	Erophila verna	39.0
Clinopodium acinos	35.0	Saxifraga tridactylites	31.0
Festuca ovina	24.0	Medicago minima aggr.	23.0
Potentilla tabernaemontani	23.0	Cerastium pumilum	22.0
Artemisia campestris	20.0	Poa bulbosa	20.0
Alyssum alyssoides	19.0	Cerastium semidecandrum	19.0
Sanguisorba minor	18.0	Hypnum cupressiforme	17.0
Abietinella abietina	16.0	Erodium cicutarium	16.0
Euphorbia cyparissias	16.0	Hornungia petraea	16.0
Poa compressa	16.0	Sedum sexangulare	16.0

Syntrichia ruralis	16.0	Tortella tortuosa	16.0
Echium vulgare	15.0	Veronica arvensis	15.0
Ditrichum flexicaule	13.0	Centaurea stoebe	12.0
Ceratodon purpureus	12.0	Galium verum	12.0
Medicago lupulina	12.0	Minuartia hybrida	12.0
Pilosella officinarum	12.0	Plantago lanceolata	12.0
Teucrium chamaedrys	12.0	Allium sphaerocephalon	11.0
Potentilla cinerea	11.0	Thymus praecox	11.0

Dominant species (percentage frequencies of occurrences with cover > 25%)

Sedum album	12.0

E1.1e - Perennial rocky grassland of the Italian Peninsula

*Diagnostic species (phi coefficient * 100)*

Festuca circummediterranea	65.3	Phleum ambiguum	61.0
Koeleria lobata	59.6	Thymus longicaulis	53.4
Brachypodium genuense	51.9	Eryngium amethystinum	51.3
Potentilla rigoana	48.2	Armeria canescens	48.1
Helictochloa versicolor subsp. praetutiana	44.5	Erysimum pseudorhaeticum	42.7
Crepis lacera	40.8	Knautia purpurea	38.5
Centaurea ambigua	38.2	Valeriana tuberosa	37.2
Cytisus spinescens	31.4	Muscari neglectum	31.4
Carex macrolepis	30.8	Asperula purpurea	30.7
Dianthus sylvestris	29.1	Galium lucidum	29.1
Arabis collina	28.9	Leontodon cichoraceus	28.9
Galium corrudifolium	28.3	Globularia meridionalis	27.7
Bunium bulbocastanum	27.3	Festuca inops	26.4
Cerastium tomentosum	26.0	Viola eugeniae	25.7
Petrorhagia saxifraga	25.6	Festuca robustifolia	25.3
Sedum rupestre	24.2	Koeleria splendens	23.6
Sideritis syriaca	23.6	Centaurea rupestris aggr.	23.4
Festuca curvula subsp. curvula	22.2	Inula montana	21.6
Bupleurum baldense	21.5	Centaurea triumfetti aggr.	21.1

Appendix E: Descriptions of the revised EUNIS grassland habitat types

In the following, the proposed EUNIS Grassland habitat names are given in bold, followed by the new habitat description. Where the proposed code and/or name differ from an original EUNIS habitat code and/or name, the latter is/are provided in italics. Original habitat descriptions are also shown in italics.

The single habitat included in this report but omitted from the Red List is shown in green. Habitats included in the Red List and omitted from the report are shown in red.

B1.4 Coastal stable dune grassland (grey dunes)
Original EUNIS description: Fixed or semifixed dunes of the coasts of the boreal, nemoral, steppe, mediterranean and warm-temperate humid zones, with the perennial grasslands, chamaephyte-dotted grasslands, forblands, subshrub or succulent communities that stabilise them and the therophyte communities that may occupy the grassland.

B1.4a Atlantic and Baltic coastal stable dune grassland (grey dunes)

Grassland of stabilised sands of fixed dunes along the north-west European coast south to Portugal, thinly enriched with accumulating humus and sharply draining, typically with a more or less complete low cover of grasses, herbs, mosses and lichens, sometimes with low shrubs. The flora can vary with the regional climate, with the character of the substrate, varying from acid to highly calcareous, and with the local dune topography. Often grazed or mown in the past.

B1.4b Mediterranean and Macaronesian coastal stable dune grassland (grey dunes)

Grassland of stabilised sands of fixed dunes around the Mediterranean and Macaronesian coasts, inland from wind erosion and salt-deposition, with a more or less complete cover of graminoids and herbs, often with a contingent of colour-ful spring annuals capitalising on early rains. The flora varies according to regional climate and dune topography.

B1.4c Black Sea coastal dune grassland (grey dunes)

Grassland on stabilised or semi-stabilised coastal sands around the Black Sea, mostly on the western and north-western stretches. The flora varies with a shift from Mediterranean to Pontic moving northwards, with many regional endemic plant species among its grasses and herbs. Perennials predominate but there can be striking contingents of annuals on more mobile stretches of sand on the ridges, and mosses and lichens can be extensive on north-facing, less sunny slopes.

E1.1 Pioneer and open perennial grasslands of inland sands and rocky terrain (= Inland sand and rock with open vegetation)
Original EUNIS description: Open, thermophile vegetation of sands or rock debris in the nemoral zone and locally, in boreal or submediterranean lowland to montane areas of Europe. Included are open grasslands on strongly to slightly calcareous inland sands, and vegetation formed mostly by annuals and succulents or semisucculents on decomposed rock surfaces of edges, ledges or knolls, with calcareous or siliceous soils.

E1.1a Pannonian and Pontic sandy steppe

Rather open steppe grassland dominated by perennial tussock-grasses and herbs, with frequent spring annuals and cryptogams, typical of nutrient-poor, sandy soils on plains and dunes through the Pannonian, Pontic and southern Baltic regions. The climate is strongly continental with cold winters, often with long frosts and shallow snow, and hot, droughty summers. Traditionally used for extensive grazing by stock, particularly sheep, but now widely abandoned.

E1.1b Cryptogam- and annual-dominated vegetation on siliceous rock outcrops
Open pioneer grassland dominated by perennial succulents and annuals, with subordinate small tussock grasses, sometimes geophytes and often a prominent contingent of cryptogams. Typically forming small stands on very shallow and skeletal, impoverished, acid soils on siliceous rock outcrops, eroded slopes and disturbed or artificial habitats like soil heaps and wall tops, the habitat occurs throughout temperate and boreal Europe up to the sub-alpine level, in situations where the permeable soils dry quickly in summer, but where spring rains can permit a quick flush of growth by the annuals.

E1.1d. Cryptogam- and annual-dominated vegetation on calcareous and ultramafic rock outcrops

Open pioneer grassland with perennial succulents and spring annuals, subordinate small tussock grasses and herbs, and often with a very prominent and rich contingent of cryptogams. Typically found in small patches on very shallow and skeletal, impoverished, base-rich soils on a wide variety of base-rich and sometimes ultramafic bedrocks, and similar artificial habitats like quarry spoil and wall-tops. It is found from the hemiboreal to the submediterranean, occurring mainly at higher altitudes further south.

E1.1e Perennial rocky grassland of the Italian peninsula

Unique to base-rich bedrocks in the Italian peninsula (and maybe Sicily) and best developed within the submediterranean bioclimatic zone, this grassland is variously dominated by perennial grasses and herbs, or mat formers and sub-shrubs on steeper, rockier ground. Generally species-rich, and sometimes with contingents of annuals and, in disturbed places, geophytes, the habitat sometimes hosts endemic plants. Developed through clearance of broadleaved

and mixed woodland it is maintained by traditional grazing in a distinctive cultural landscape.

E1.1f Continental dry rocky steppic grasslands and dwarf scrub on chalk outcrops

Original EMERALD description: Communities of chamaeophytes on cretaceous outcrops in the steppe and southern forest-steppe zones in the Don and (probably) Volga basins. A mix of continental steppes is typical. The community is usually open, and plant cover varies from 30-70%, with several threatened plant species.

Usually open vegetation dominated by perennial mat-forming Continental steppe plants on free-draining base-rich soils of rocky chalk outcrops in the Don and (probably) Volga basins.

1.1g Perennial rocky grassland of Central Europe and the Carpathians

Open grassland generally dominated by perennial grasses with rich mixtures of associated rosette herbs, mat-formers and geophytes, and towards southern Europe especially, annuals. It occurs on shallow, impoverished soils over both calcareous and siliceous bedrocks, through the lowlands and submontane zone of central and southern Europe, best developed on steeper ground uncongenial for agriculture, but extended where woodland clearance and grazing, particularly by goats, have been part of traditional farming.

E1.1h Heavy metal dry grassland of the Balkans

Grassland confined to droughty, nutrient-poor soils rich in heavy metals derived from ultramafic rocks in the mountains of the Balkans and Cyprus with an open cover of grasses and forbs, including many endemics.

E1.1i Perennial rocky calcareous grassland of subatlantic-submediterranean Europe

Open grasslands, dominated by perennials and especially rich in mat-formers, typical of rudimentary, shallow, nutrient-poor, base-rich soils over sloping, rubbly limestone terrain through the lowland to sub-montane levels in subatlantic and submediterranean Europe where traditionally maintained by extensive grazing.

E1.1j Dry steppic, submediterranean pasture of South-Eastern Europe

Dry steppic pasture typical of sharply-draining, base-rich soils developed over valley sides, dolines and sink-holes around the Adriatic coasts where the submediterranean climate is characterised by late autumn and spring rains and summer drought. Dominated by often rich mixtures of graminoids, forbs and mat-formers, the habitat is dependent on extensive grazing and now often survives patchily among mosaics of scrub and woodland.

E1.2 - Perennial calcareous grassland and basic steppes
Original EUNIS description: Perennial grasslands, often nutrient-poor and species-rich, on calcareous and other basic soils of the nemoral and steppe zones and of adjacent parts of the subboreal and submediterranean zones. Includes the calcareous grasslands of central and western Europe, alvar grasslands of the Baltic region, and basic grasslands of the steppe zone

E1.2a Semi-dry perennial calcareous grassland

Semi-natural grassland on deeper and not so drought-prone, nutrient-poor, base-rich soils over limestones throughout the lowlands and sub-montane levels of submediterranean to hemiboreal Europe. Generally closed and dominated by mixtures of graminoids and forbs, often extremely species rich, with many rare plants and sometimes striking contingents of orchids and varying much across the large range with different sets of continental or sub-mediterranean companions. Dependent on extensive grazing, usually with sheep, or on an annual mowing, and often developed over centuries of traditional pastoralism, contributing to some striking cultural landscapes.

E1.2b Continental dry steppe

Steppe and steppe-like grassland on mostly base-rich soils over limestones, of varying depth and stoniness, occurring through the Continental lowlands to sub-montane belts of Europe. Dominated by plants adapted to long periods of summer drought, mostly tall tussock grasses and perennial forbs, it shows wide variation in species composition and particular topographic location across the substantial range. In more extreme situations, the grasslands are natural, but they often sustain extensive grazing.

E1.3 Mediterranean xeric grassland
Original EUNIS description: Meso- and thermo-Mediterranean xerophile, mostly open, short-grass perennial grasslands rich in therophytes; therophyte communities of oligotrophic soils on base-rich, often calcareous substrates.

E1.3a Mediterranean closely-grazed dry grassland

Heavily-grazed pasture of the Mediterranean basin, mostly on silt and clay soils in the lowlands, dominated by rosette plants and small grasses tolerant of intensive herbivory and trampling. The soils are dry in summer which helps exclude nitrophilous plants that might be encouraged by dunging but, refreshed by autumn rains, the herbage remains green and productive through the winter, providing valuable forage. Companion plants vary widely across the large range.

E1.3b Mediterranean tall perennial dry grassland

Grassland of impoverished, base-rich soils over various calcareous bedrocks through the Mediterranean region, where grazing and trampling sustain open or closed swards generally dominated by tall, dense tussock grasses that lend

a steppe-like character. Summer drought and disturbance help prevent reversion to woodland but can encourage the invasion of aliens.

E1.3c Mediterranean annual-rich dry grassland

Usually ephemeral vegetation related to the yearly cycle of spring rains and summer drought through the Mediterranean zone where a high diversity of small annual plants make a brief colourful appearance on bare patches of mainly base-rich soils. The species composition varies greatly, according to the particular regional terrain and climate and the impact of traditional pastoralism.

E1.5 Mediterranean montane grassland

Original EUNIS description: Open perennial grasslands, often rich in chamaephytes, most characteristic of the thermophilous oak level of Iberia, southern France, southern Italy, Greece and the Balkans. Some of the largest remaining expanses of unbroken grasslands in Europe, of evident importance as faunal habitats, belong to this division.

E1.5a Iberian oromediterranean siliceous dry grassland

Grassland of base-poor soils over siliceous bedrocks on the slopes and crests of high mountains in the Iberian Peninsula with a short growing season and harsh winters with strong winds which blow the ground free of snow and leave the surface subject to deep cold and the development of freeze-thaw features. The vegetation cover, moderately open to closed, is dominated by prostrate or dwarf grasses and forbs, and includes many endemics.

E1.5b Iberian oromediterranean basiphilous dry grassland

Grassland of base-rich soils over calcareous bedrocks on the slopes and crests of high mountains in the Iberian Peninsula and France, with a short growing season and harsh winters when strong winds blow the ground free of snow and leave the surface subject to deep cold which encourages the development of freeze-thaw features. The vegetation cover, moderately open to closed, is dominated by prostrate or dwarf grasses and forbs, and includes many endemics.

E1.5c Cyrno-Sardean oromediterranean siliceous dry grassland

Grassland of base-poor soils over siliceous bedrocks on the slopes and crests of high mountains in Corsica and (probably) Sardinia, with a short growing season and harsh winters when strong winds blow the ground free of snow and leave the surface subject to deep cold which encourages the development of freeze-thaw features. The cover of vegetation is intermediate to complete, dominated by prostrate herbs, cushion plants and dwarf shrubs, and includes many endemics.

E1.5d Greek and Anatolian oromediterranean siliceous dry grassland

Closed grassland of deeper acid soils occurring over various bedrocks above the tree-line on high mountain slopes and hollows in Greece and Anatolia where snow accumulates and provides springtime irrigation with melt-water. The vegetation is species-rich but the dominants and associates vary from place to place. It provides valuable summer grazing for traditional pastoralism.

E1.5e Madeirean oromediterranean siliceous dry grassland

Highly distinctive tussocky grassland, rich in endemics, restricted to high mountains in Madeira, where it occurs in crevices and on ledges in silicate volcanics where the soils are kept permanently moist by the very humid climate. Typically occurring in mosaics with heaths and woodlands, the decline of domestic goat grazing has favoured its extension into what were once more accessible situations.

E1.7a Lowland to submontane, dry to mesic Nardus grassland

E1.7 Non-Mediterranean dry acid and neutral closed grassland
Original EUNIS description: Closed, dry or mesophile, perennial grasslands occupying acid soils in Atlantic or sub-Atlantic lowland to montane regions of northern Europe, middle Europe and western Iberia, with Nardus stricta, Festuca filiformis (Festuca tenuifolia), Festuca ovina, Festuca rubra, Agrostis capillaris, Danthonia decumbens, Anthoxanthum odoratum, Deschampsia flexuosa, Poa angustifolia, Galium saxatile, Polygala vulgaris, Viola canina, Meum athamanticum, Arnica montana, Centaurea nigra, Dianthus deltoides, Gentianella campestris, Chamaespartium sagittale, Jasione laevis, Potentilla erecta, Carex pilulifera. Any of the grasses listed can dominate or codominate distinctive facies; Calamagrostis epigejos or Carex arenaria also can invade and dominate some formations.

Usually dominated by the tightly tussocky *Nardus stricta,* this grassland is characteristic of nutrient-poor, acidic soils, sometimes seasonally wet, on siliceous substrates through the entire lowlands and sub-montane zone of temperate Europe, though optimally developed in the cooler and rainier climate of the Atlantic zone. Other grasses may share dominance but the associated flora is generally rather species-poor and related to the type and intensity of grazing.

E1.8 Open Iberian supramediterranean dry acid and neutral grassland

E1.8 Mediterranean dry acid and neutral closed grassland
Original EUNIS description: Perennial grasslands on acid soils of the supra-Mediterranean zone, dominated by e.g. Festuca elegans or Nardus stricta. Mediterranean annual-rich siliceous grassland of siliceous gravelly, sandy or silty, usually shallow, soils that remain cohesive during the dry season.

Dominated by small tussock grasses, forbs and mat-formers, including many endemics, this grassland occurs on shallow skeletal soils, nutrient-poor and

drought-prone, developed over outcrops of siliceous and ultramafic bedrocks at moderate to high altitudes in the western Iberian Peninsula. Traditionally part of pastoral landscapes, grazed mostly by sheep.

E1.9 Non-Mediterranean dry acid and neutral open grassland, including inland dune grassland
Original EUNIS description: Open grassland, often with therophytes, of the nemoral, boreonemoral and submediterranean zones, developed on raw non-calcareous soils, especially on inland dunes and fixed sands.This group of Koelerio-Corynephoeretea alliances replicates the first block of alliances within E1.1 (and E1.7)

E1.9a Oceanic to subcontinental inland sand grassland on dry acid and neutral soils

Moderately open to closed grassland on nutrient-poor sandy soils, mostly acid to neutral though sometimes calcareous, on plains, river terraces and cliffs through the lowlands and sub-montane belts of temperate Europe. Narrow-leaved, tussocky graminoids dominate, associated herbs can be very numerous and more open swards can have rich annual and cryptogam floras. Across the wide range, there is considerable variety among the dominants and companions and the extreme topoclimate can provide a western outpost for steppe elements.

E1.9b Inland sanddrift and dune with siliceous grasslands

Usually sparse grasslands on sand drifts among inland dunes and other open landscapes, mainly in the north central European lowlands, where the nutrient-poor and highly acidic surface is prone to wind erosion and hot droughty summers, forming a highly distinctive 'Atlantic desert' landscape. Soil development is very slow, pioneer moss vegetation succeeded by an open cover of small tussocky grasses, often with rich contingents of lichens on the compacted surface. Military training zones and abandoned lignite areas provide new situations.

E1.A Mediterranean to Atlantic open, dry, acid and neutral grassland

E1.A Mediterranean dry acid and neutral open grassland
Original EUNIS-3 description: Sandy open ground with vernal therophytes, not necessarily grasses, in the Mediterranean region. Open perennial grasslands and pastures on siliceous, usually skeletal, soils of the supra-Mediterranean zone.

Usually ephemeral vegetation related to the yearly cycle of spring rains and summer drought through the western Mediterranean and more fragmentarily into the Atlantic and Continental zones where a high diversity of small annual plants make a brief colourful appearance on bare patches of nutrient-poor, acidic soils. Typically, the habitat occurs as small patches in intimate mosaics with heath and scrub and has provided a valuable supplementary resource for sheep at lambing time.

E1.B Heavy-metal grassland in Western and Central Europe
E1.B Heavy metal grassland
Original EUNIS description: Dry, short grasslands, often rich in lichens and mosses, colonizing western and central European soils with a high content in hea y metals such as zinc and lead, and comprising uniquely adapted species, ecotypes or populations mostly related to, or derived from, otherwise montane, boreomontane or steppic species; heavy metal grasslands of distinctly alpine affinities, though spanning an altitudinal range that extends from the montane level and lowland dealpine stations to the subalpine and alpine levels, are included.

Short open sward with a distinctive metallophyte component, occurring on shallow, skeletal soils over natural rock exposures with heavy metals in Western and Central Europe, on mine spoil or ground contaminated by dust and waters from such sources. Typically occurs locally in other landscapes, colonising slowly and sustained by the extreme environment, though also sometimes dependent on grazing by wild herbivores for maintaining early successional stages which are richer in cryptogams.

E1.F Azorean open dry, acid to neutral grassland

Ungrazed grassland, with mixtures of grasses, herbs and mat-formers, including many endemics which may dominate, confined to the Azores where it is characteristic of exposed or unstable rocky slopes, ledges and landslips with nutrient-poor acid soils. The species composition varies according to the altitude and climate, rock type and stability of the terrain.

E2.1a Mesic permanent pasture of lowlands and mountains
E2.1 Permanent mesotrophic pastures and aftermath-grazed meadows

Original EUNIS description: Regularly grazed mesotrophic pastures of Europe, fertilised and on well-drained soils, with Lolium perenne, Cynosurus cristatus, Poa spp., Festuca spp., Trifolium repens, Leontodon autumnalis, Bellis perennis, Ranunculus repens, Ranunculus acris, Cardamine pratensis; they are most characteristic of the nemoral and boreonemoral zones Europe, but extend to the Cordillera Central, the Apennines and the supra-Mediterranean zone of the Balkan peninsula and Greece.

The most common and widespread kind of traditionally managed pasture on deeper, well-drained mesic soils throughout temperate Europe, with many local types related to regional climate, terrain and pastoral traditions. Typically dominated by mixtures of productive grasses and herbs, it can be species-rich with distinctive scarce and rare plants where low input grazing and dunging are maintained. Often once part of wider pastoral landscapes with distinctive associated meadows, it is now widely transformed by intensive grazing and transitions are commonplace.

E2.2 Low and medium altitude hay meadow
E2.2 Low and medium altitude hay meadows

Original EUNIS description: Mesotrophic hay meadows of low altitudes of Europe, fertilised and well-drained, with Arrhenatherum elatius, Trisetum flavescens, Anthriscus sylvestris, Heracleum sphondylium, Daucus carota, Crepis biennis, Knautia arvensis, Leucanthemum vulgare, Pimpinella major, Trifolium dubium, Geranium pratense; they are most characteristic of the nemoral and boreonemoral zones of Europe, but extend to the Cordillera Central, the Apennines and the supra-Mediterranean zone of the Balkan peninsula and Greece.

The most common and widespread kind of traditionally managed meadow in deeper, well-drained mesic soils throughout the lowlands and foothills of temperate Europe, with many local types differing according to regional climate, terrain and mowing traditions. Typically dominated by mixtures of productive grasses and herbs, it can be very species-rich with distinctive scarce and rare plants where traditional regimes of mowing, grazing and dunging are maintained. Often once part of wider agricultural landscapes with distinctive associated pastures, it is now widely transformed by shifts to silage production and transitions to intensive silage grasslands are commonplace.

E2.3 Mountain hay meadow

E2.3 Mountain hay meadows

Original EUNIS description: Often species-rich hay meadows of the montane and subalpine levels of higher mountains of the nemoral and southern boreal zones.

The typical kind of traditionally-managed meadow on deep, well-drained, mesic soils throughout the mountains of northern and central Europe where there is a short cool growing season. There are many local types differing according to regional climate, terrain and farming traditions but the vegetation is typically dominated by mixtures of productive grasses and herbs, and can be species-rich with distinctive scarce and rare plants where traditional regimes of mowing, grazing and dunging are maintained. Often once part of wider agricultural landscapes with distinctive associated pastures, good examples of the habitat now often survive more fragmentarily and transitions to improved silage grassland are widespread.

E2.4 Iberian summer pasture (vallicares)

E2.4 Iberian summer pastures (vallicares)

Original EUNIS description: Summer pastures of the Iberian peninsula, subject to poor drainage, brief flooding and rapid desiccation with the first heat, composed of perennial and annual grasses, most commonly by Agrostis castellana, Agrostis pourretii (Agrostis salmantica), Gaudinia fragilis, Festuca ampla, Periballia involucrata, Vulpia ciliata, Vulpia myuros, Vulpia bromoides, Holcus setiglumis, Molineriella minuta, Anthoxanthum aristatum, Anthoxanthum ovatum and often with Juncus capitatus and clovers such as Trifolium campestre.

Highly distinctive tall grass pasture and meadow associated with traditional cattle rearing in the lowlands and foothills of western Iberia where a mediterranean or submediterranean climate and the long-established grazing

and occasional mowing regimes sustain a striking contingent of regional plants and association with dehesa. The substrate is sandy or clayey, often subject to temporary flooding with rapid dessication, conditions which affect the pattern of grass dominance.

E3.1 Mediterranean tall humid grassland

Original EUNIS-3 description: Mediterranean humid grasslands of tall grasses and rushes with Scirpus holoschoenus (Holoschoenus vulgaris), Agrostis stolonifera, Agrostis reuteri, Calamagrostis epigejos, Galium debile, Molinia caerulea, Briza minor, Melica cupanii, Cyperus longus, Linum tenue, Trifolium resupinatum, Schoenus nigricans, Peucedanum hispanicum, Carex mairii, Juncus maritimus, Juncus acutus, Asteriscus aquaticus, Hypericum tomentosum, Hypericum tetrapterum, Inula viscosa, Oenanthe pimpinelloides, Oenanthe lachenalii, Eupatorium cannabinum, Prunella vulgaris, Pulicaria dysenterica, Tetragonolobus maritimus, Orchis laxiflora, Dactylorhiza elata, Succisa pratensis, Sonchus maritimus ssp. aquatilis, Silaum silaus, Sanguisorba officinalis, Serratula tinctoria, Genista tinctoria, Cirsium monspessulanum, Cirsium pyrenaicum, Senecio doria, Dorycnium rectum, Erica terminalis, Euphorbia pubescens, Lysimachia ephemerum, widespread in the entire Mediterranean basin, extending, along the coasts of the Black Sea, in particular in dune systems, north to the Dobrogea and the Danube Delta, and, in valleys of the Balkan peninsula, north to the Banat.

E3.1a Mediterranean tall humid inland grassland

Rush- and tall grass-dominated vegetation of seasonally waterlogged soils, mostly acidic, occurring in depressions throughout the Mediterranean basin. Though not dependent on grazing, it can be a valuable source of fodder for cattle and sheep in traditional pastoral systems during summer when other pastures are dried up.

E3.2 Mediterranean short humid grassland

Original EUNIS description: Very short grasslands of impermeable compact soils or marls, wet for a large part of the year, and desiccated in summer, characteristic of the Mediterranean basin, with irradiations north to the Illyrian zone of the northwestern Balkan peninsula, with Deschampsia media, Centaurium pulchellum, Lotus tenuis, Trifolium lappaceum, Prunella hyssopifolia, Plantago maritima ssp. serpentina, Centaurea timbali.

E3.2a Mediterranean short moist grassland of lowlands

Short species-rich grassy sward, traditionally sustained by heavy grazing, on clay soils through the Mediterranean region where there is winter waterlogging and distinctive surface cracking in the droughty summer.

E3.2b Mediterranean short moist grassland of mountains

Closed tussocky grassland of moist ground at high altitudes in the west Mediterranean which, remaining green through the summer, provide valuable grazing for transhumant cattle and sheep.

E3.3 Submediterranean moist meadows

E3.3 Submediterranean humid meadows

Original EUNIS description: Humid meadows rich in clover (Trifolium spp.) of sub- and supramediterranean regions remote from Atlantic influence, in particular, of the Balkan peninsula, of the Apennines and of Mediterranean Anatolia, mostly developed above the lowlands but below the montane level.

Moist meadows of sandy to clayey, mesotrophic to eutrophic soils on riverside terraces and gentle slopes, mainly within the lowlands and sub-montane zone of south-eastern Europe, extending westwards to Central Italy. Winter and spring flooding is common but later in the season the ground may dry up and become locally saline. The species composition reflects regional differences in temperature and rainfall but patterns of mowing and grazing can also affect the species composition.

E3.4 Moist or wet eutrophic and mesotrophic grassland

Original EUNIS description: Wet eutrophic and mesotrophic grasslands and flood meadows of the boreal and nemoral zones, dominated by grasses Poaceae, rushes Juncus spp. or club-rush Scirpus sylvaticus.

E3.4a Moist or wet mesotrophic to eutrophic hay meadow

Meadows of moist, sometimes seasonally flooded, nutrient-rich soils on floodplains and in brook-valleys throughout lowland and submontane Europe. Traditionally cut for hay, though sometimes also light grazed in late summer and autumn, the vegetation is often species-rich with a diverse associated invertebrate fauna attracted by the abundance of flowers. Often once part of wider agricultural landscapes with distinctive associated pastures, good examples of the habitat now often survive more fragmentarily and transitions to improved silage grassland on flood-protected land are widespread.

E3.4b Moist or wet mesotrophic to eutrophic pasture

Pastures of moist to wet, mesotrophic to eutrophic soils, generally inundated during winter and spring, on floodplains, lake shores and ditchsides throughout temperate Europe, sometimes with a brackish influence. Grazing is mostly by cattle which can strongly affect the nutrient status and compaction of the soil and plants tolerant of inundation and trampling dominate here with a paucity of attractive flowers and a poor associated invertebrate fauna.

E3.5 Temperate and boreal moist or wet oligotrophic grassland

E3.5 Moist or wet oligotrophic grassland

Original EUNIS description: Grasslands on wet, nutrient-poor, often peaty soils, of the boreal, nemoral and steppe zones. Includes coarse acid grassland dominated by Molinia caerulea and shorter wet heathy grasslands with Juncus squarrosus, Nardus stricta and Scirpus cespitosus.

Meadows and pastures of less nutrient-rich soils, wet for much of the year, though not inundated by flood-waters and drying out in summer, especially in more Continental regions. The soils may be somewhat acidic to base-rich, sometimes peaty above, and through the lowlands and sub-montane zones of Europe, they have been part of wider landscapes among fens and drier grasslands. Less productive than flood meadows, they are mown just once a year, and towards the west of the range, often just lightly grazed, but they can be species-rich with some characteristic and striking species.

E4.1 Vegetated snow patch
Original EUNIS-3 description: Vegetated areas that retain late-lying snow. Dominants may be mosses, liverworts, macrolichens, graminoids, ferns and small herbs. Snow patches are well developed in boreal and arctic mountains and in subarctic lowlands; they are well represented, though of much smaller extent, above the tree limit in the Alps, Pyrenees, Carpathians and Caucasus. They are found very locally in the Paeonian mountains, Sierra Nevada, Cordillera Central, Monti Sibillini, Abruzzi, Scottish Highlands and Sudeten.

Vegetation on skeletal, sometimes humic, soils developed beneath late-lying snow patches in boreal and arctic mountains and the subarctic lowlands of Europe. Dominated by grasses, sedges, herbs and cryptogams, the species composition depends on regional climate, altitude, bedrock and soil type, and sometimes includes endemics, particular on high south European peaks.

E4.3 Acid alpine and subalpine grassland
EUNIS-3 description: Alpine and subalpine grasslands developed over crystalline rocks and other lime-deficient substrates or on decalcified soils of mountains. On boreal mountains, Carex bigelowii and Juncus trifidus often dominate. The acid alpine grasslands of central Europe are more mixed, with Armeria alpina, Armeria alliacea (Armeria montana), Euphrasia minima, Gentiana alpina, Geum montanum, Juncus trifidus, Lychnis alpina, Pedicularis pyrenaica, Phyteuma hemisphaericum, Pulsatilla alpina ssp. sulphurea, Ranunculus pyrenaeus, Sempervivum montanum, Botrychium lunaria.

E4.3a Boreal and arctic acidophilous alpine grassland

Boreal and arctic acidophilous alpine grasslands, dominated by low graminoids and herbs, characteristic of shallow mostly base-poor soils with thick late snow-lie, occurring through the high mountains of Fennoscandia, Iceland and Scotland.

E4.3b Temperate acidophilous alpine grassland

Grassland and dwarf chamaephyte vegetation on skeletal and shallow soils over predominantly siliceous bedrocks in the alpine belt throughout the temperate mountains of Europe, typical of the highest summits and ridges, often very exposed to strong winds and largely blown clear of snow in the winter.

E4.4 Calcareous alpine and subalpine grassland

Original EUNIS description: Alpine and subalpine grasslands of base-rich soils of the high mountains of the nemoral, submediterranean and supramediterranean zones. Characteristic species of the Alps include Dryas octopetala, Gentiana nivalis, Gentiana campestris, Alchemilla hoppeana, Alchemilla conjuncta, Alchemilla flabellata, Anthyllis vulneraria, Astragalus alpinus, Aster alpinus, Draba aizoides, Globularia nudicaulis, Helianthemum nummularium ssp. grandiflorum, Helianthemum oelandicum ssp. alpestre, Pulsatilla alpina ssp. alpina, Phyteuma orbiculare, Astrantia major and Polygala alpestris.

E4.4a Arctic-alpine calcareous grassland

Grasslands on shallow, highly calcareous soils on limestone or dolomite slopes and ridges in the alpine or subalpine belts of the high mountains of the nemoral zone, being best developed in the Alps, but occurring also in the Carpathians and Pyrenees, with small fragmentary stands also in the Sudetes and in Scotland. Grasses and sedges dominate, along with numerous small herbs, the cover varying from sparse to complete according to the soil depth.

E4.4b Alpine and subalpine calcareous grassland of the Balkans and Apennines

Grass-dominated vegetation of base-rich soilsd in the high mountains in the Balkans and Appenines including both primary vegetation above the tree-line but also secondary grasslands maintained by grazing at lower altitudes.

E5.2 Thermophile woodland fringes
Original EUNIS-3 description: Woodland edge (seam) vegetation of the nemoral, boreo-nemoral and submediterranean zones, composed of warmth-requiring drought-resistant herbaceous perennials and shrubs, which form a belt between dry or mesophile grasslands and the shrubby forest mantle, on the sunny side, where the nutrient supply is limited, or, sometimes, pioneering the woodland colonization into the grasslands.

E5.2a Thermophilous woodland fringe of base-rich soils

Fringe communities on neutral to base-rich, only moderately nutrient-rich, soils in the transition zone between forests and open habitats or in similar situations alongside cliffs and on roadsides, occuring across large parts of lowland north-west Europe, but also extending into more continental regions where they fringe more open thermophilous forests, and into cooler montane levels to the south and south-east. Typically comprising half-shade plants, other species of neighbouring habitats can also find a place and, in calcareous landscapes, the vegetation can be more species rich, harbouring a lot of rare and/or endangered species. vegetation. Dependent on grazing and/or mowing for preventing succession.

E5.2b Thermophilous woodland fringe of acidic soils

Fringe vegetation of semi-shaded forest margins and similar situations on acidic, nutrient-poor soils in the cooler Atlantic and Subatlantic regions of Europe, becoming rare and more species-poor further east. It is generally dominated by bulky grasses and tall herbs, rather species-poor, and ultimately dependent on extensive grazing or occasional mowing to prevent encroachment by shrubs and trees that threaten denser shade.

E5.2c Macaronesian thermophilous woodland fringes

Perennial herbaceous communities of the warm half-shade of woodland fringes and clearings of Macaronesian laurel-forests in the Canary Islands, Azores and Madeira. It is found as sunnier micro-sites in or along humid woodland edges but is dependent on forest litterfall producing somewhat mesotrophic conditions.

E5.3 Pteridium aquilinum stand
E5.3 Pteridium aquilinum fields
Original EUNIS description: Atlantic, sub-Atlantic, sub-Mediterranean and Macaronesian communities dominated by the large fern Pteridium aquilinum, extensive and often closed.
Dense species-poor stands of Pteridium, naturally a lowland European forest fern which, when not held in check by dense shade and lacking the traditional management of cutting and trampling by cattle, readily establishes itself as a dominant, spreading vigorously by rhizome extension and producing deep litter, a feature now of many pastoral landscapes less traditionally managed than before.

E5.4 Moist or wet tall-herb and fern fringe of the lowlands
E5.4 Moist or wet tall-herb and fern fringes and meadows
EUNIS-3 description: Tall-herb and fern vegetation of the nemoral and boreal zones, including stands of tall herbs on hills and mountains below the montane level. Tall herbs are often dominant along watercourses, in wet meadows and in shade at the edge of woodlands.

Tall-herb and fern-dominated communities of moist, sometimes flooded, nutrient-rich soils in the lowlands and lower mountain areas of Europe, up to the subalpine zone, through the nemoral, boreal and submediterranean regions. The relatively species-rich vegetation may be found in river floodplains, along smaller watercourses, in the shade at the edge of woodlands, often as narrow strips, and, as secondary vegetation after the abandonment of pastures and especially meadows. The species composition is quite diverse, depending on the altitude, geographic distribution and location in the landscape.

E5.5 Subalpine moist or wet tall-herb and fern fringe
E5.5 Subalpine moist or wet tall-herb and fern stands
Original EUNIS description: Luxuriant tall herb formations of deep, humid soils in the montane to alpine, but mostly subalpine, levels of the higher mountains, with Cicerbita alpina, Cicerbita alpina plumieri, Cirsium helenioides, Cirsium spinosissimum, Cirsium flavispina, Geranium sylvaticum,

Polygonatum verticillatum, Ranunculus platanifolius, Aconitum vulparia, Aconitum napellus, Aconitum nevadense, Adenostyles alliariae, Senecio elodes, Veratrum album, Trollius europaeus, Peucedanum ostruthium, Doronicum austriacum, Pedicularis foliosa, Eryngium alpinum, Leuzea rhapontica (Centaurea rhapontica), Valeriana pyrenaica, Tozzia alpina.

Tall forb and fern vegetation of moist, fertile soils in relatively cool and humid situations through high levels of the mountain ranges of Europe, having its optimum in the subalpine zone but also occurring in the arctic lowlands of Scandinavia. Typically found as strips along streams and on the edges of forests, in the shelter of large rocks, on mountain ledges and under scrub, sometimes also fringing snowbeds where it benefits from protection from winter frosts. The vegetation is often very rich in species and hosts many local and regional endemics, as well as widespread montane plants. Vulnerable to grazing by wild herbivores and stock, but often protected by its remoteness.

E6.1 Mediterranean inland salt steppe

E6.1 Mediterranean inland salt steppes
Original EUNIS description: Vegetated saline land of Mediterranean coastal regions and of the fringes of semiarid salt basins that lack drainage to the sea; often dominated by perennial, rosette-forming Limonium spp. or esparto grass, Lygeum spartum. The soils are temporarily permeated (though not inundated) by saline water and subject to extreme summer drying, with formation of salt efflorescences.

Halophyte vegetation of inland situations in the Mediterranean region where the soils of flats or gentle hollows are permeated by waters laden with soluble salts from underlying substrates, and are then subject to extreme summer drought, with surface efflorescence of crystalline deposits. The vegetation can be rich in endemics, but the particular species composition depends on the regional climate and local soil conditions and there is often a distinctive seasonal pattern of growth and zonation around the hollows. In some regions, the vegetation has provided valuable grazing for sheep and goats in summer drought.

E6.2 Continental inland salt steppe

E6.2 Continental inland salt steppes
Original EUNIS description: Salt steppes and their associated salt-tolerant herbaceous communities outside the Mediterranean zone. In Europe they are found in the substeppe and steppe zones eastwards from the Hungarian Plain.

Salt steppe of the Pannonian biogeographic region, characteristic of solonetz soils, saturated, even shallow flooded, by soluble carbonates in spring, then drying in summer with surface cracking. According to variations in salinity, slope and erosion by spring floods, the vegetation is a complex mosaic of grasslands and more halophytic herb communities, rich in endemic species and plant communities. Traditionally part of the pastoral landscape of older breeds of cattle.

E6.3 Temperate inland saltmarsh

D6.1 Inland salt-marshes
Original EUNIS description: Salt meadows and swards of Salicornia and other Chenopodiaceae of inland salt basins of the nemoral zone. Inland saltmarshes of middle Europe are remarkable, extremely threatened communities occurring in a few isolated stations of Saxony and Lower Saxony, Schleswig-Holstein, Thuringia, Hesse, Lorraine, Auvergne, the Midlands and southeastern Poland (lower Nida valley).

Inland salt marsh and meadow of temperate and continental regions, characteristic of situations where fossil salt lies close to the surface or where relict sea water is present, resulting in brackish or saline ground and surface water. In more continental regions inland salt pans are more common, where the habitat is found in depressions within a matrix of salt steppes and as sub-halophytic meadows. Elsewhere in Europe, the habitat can be found in association with a variety of salty bedrocks and also on abandoned salt workings. The species composition is very varied according the regional climate and particular site conditions.

E7.1 Temperate wooded pasture and meadow
E7.1 Atlantic parkland
Original EUNIS description: Extensive surfaces of Atlantic regions of nemoral Europe occupied by grassland dotted with widely planted trees, characteristic of the British Isles, where they are usually enclosed, used for cattle or deer grazing.

A very diverse landscape-scale habitat occurring across the nemoral zone of Europe where different traditions of grazing, mowing and silviculture have together created distinctive associations of trees growing among pastures and meadows. Such wood-pastures, wooded steppes, park meadows, grazed orchards, parklands and open hunting forests, variously managed for stock rearing, hay production, coppice and timber products, represent highly distinctive social and economic histories and can express great cultural traditions. Species-rich types occur, including contingents of epiphytic plants growing on veteran trees but, even where the components are more commonplace, the combinations of floristic and structural elements are striking.

E7.2 Hemiboreal and boreal wooded pasture and meadow
E7.2 Sub-continental parkland
Original EUNIS description: Grassland dotted with widely planted trees, to the east of the Atlantic zone of nemoral Europe.

Open wooded landscapes of the lowlands, foothills and mountains of the boreal zone, traditionally managed for grazing, hay-making and woodland products, mainly by pollarding. Diverse very open canopies of broadleaved and coniferous trees, including veterans sometimes with rich epiphytic cryptogam floras, often with few or no associated shrubs, occur scattered over pasture and meadow vegetation. Long traditions of complex interactions and cultural associations make these landscapes both dynamic and distinctive.

E7.3 Mediterranean wooded pasture and meadow

E7.3 Dehesa

Original EUNIS description: A characteristic landscape of the southwestern quadrant of the Iberian peninsula in which crops, pasture land or Mediterranean scrub, in juxtaposition or rotation, are shaded by a fairly closed to very open canopy of native oaks, Quercus suber, Quercus rotundifolia, Quercus pyrenaica, Quercus faginea. It is an important habitat of raptors, including the threatened Iberian endemic eagle Aquila adalberti, of the crane Grus grus, of large insects and their predators and of the endangered Iberian lynx Lynx pardinus.

Open wooded landscapes created and maintained through combinations of traditional grazing, hay-making and tree management in the Mediterranean region. Variations in the local climate, topography and interventions, and the accumulation of long cultural traditions of use have resulted in a variety of highly distinctive types such as the dehesas of Spain and montados of Portugal. Typically the tree canopy is of evergreen broadleaved trees, variously with veterans, pollards or coppice, often with elements of sclerophyllous scrub beneath, and perennial and annual grasses and herbs in the field layer. In some traditions, there can even be small arable areas.

The Habitat descriptions from the European Red List of Habitats which were used as the basis of these EUNIS Habitat descriptions were written/edited by Capelo, J., Čarni, A., Chytrý, M., Dimopoulos, P., Fotiadis, G., Janssen, J., Loidi, J., Mäkelä, K., Molnar, Z., Rodwell, J., Schaminée, J.H.J., Šibik, J., Tsonev, R., Varga, A. and Vrahnakis, M.

Appendix F: List of data providers

Country/Region	Custodian	Deputy custodian	Database GIVD
Albania	Michele De Sanctis	Giuliano Fanelli	Vegetation Database of Albania
Austria	Wolfgang Willner		Austrian Vegetation Database
Balkan	Kiril Vassilev		Balkan Dry Grasslands Database
	Kiril Vassilev	Hristo Pedashenko	Balkan Vegetation Database
Baltic region	Jürgen Dengler	Łukasz Kozub	Nordic-Baltic Grassland Vegetation Database (NBGVD)
Basque Country	Idoia Biurrun	Itziar García-Mijangos	Vegetation-Plot Database of the University of the Basque Country (BIOVEG)
Belarus	Flavia Landucci		WetVegEurope
Belgium	Els De Bie		INBOVEG
	Els De Bie		INBOVEG
Bulgaria	Iva Apostolova	Desislava Sopotlieva	Bulgarian Vegetation Database
Caucasus	Veronika Kalníková	Helmut Kudrnovsky	
	Vladimir Onipchenko	Alexei Egorov	
Croatia	Zvjezdana Stančić		Phytosociological Database of Non-Forest Vegetation in Croatia
	Željko Škvorc	Daniel Krstonošić	Croatian Vegetation Database
Czech Republic	Milan Chytrý	Dana Michalcová	Czech National Phytosociological Database
Denmark	Jesper Erenskjold Moeslund	Rasmus Ejrnæs	National Vegetation Database of Denmark
Estonia	Flavia Landucci		WetVegEurope
Europe	Corrado Marcenò	Borja Jiménez-Alfaro	Mediterranean Ammophiletea database
	Risto Virtanen		Vegetation Database of Eurasian Tundra
	John Janssen		European Coastal Vegetation Database
	Tomáš Peterka	Martin Jiroušek	European Mire Vegetation Database
	Tomáš	Martin	European Mire Vegetation

	Peterka	Jiroušek	Database
	Veronika Kalníková	Helmut Kudrnovsky	
	Andraž Čarni		SE Europe forest database

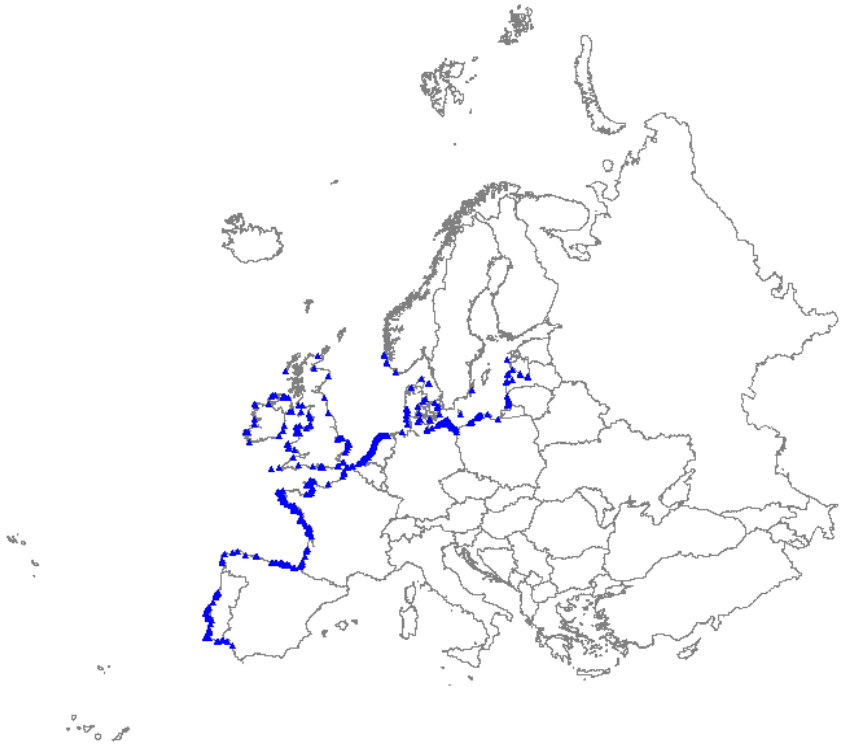
Appendix G: Maps of distribution of phytosociological relevés of the revised EUNIS grassland habitat types

Code	Name	# of plots
B1.4a	Atlantic and Baltic coastal dune grassland (grey dune)	3550
B1.4b	Mediterranean and Macaronesian coastal dune grassland (grey dune)	5241
B1.4c	Black Sea coastal dune grassland (grey dune)	547
E1.1a	Pannonian and Pontic sandy steppe	790
E1.1b	Cryptogam- and annual-dominated vegetation on siliceous rock outcrops	1180
E1.1d	Cryptogam- and annual-dominated vegetation on calcareous and ultramafic rock outcrops	1922
E1.1e	Perennial rocky grassland of the Italian Peninsula	422
E1.1f	Continental dry rocky steppic grassland and dwarf scrub on chalk outcrops	169
E1.1g	Perennial rocky grassland of Central Europe and the Carpathians	1623
E1.1h	Heavy-metal dry grassland of the Balkans	86
E1.1i	Perennial rocky calcareous grassland of subatlantic-submediterranean Europe	2179
E1.1j	Dry steppic, submediterranean pasture of South-Eastern Europe	337
E1.2a	Semi-dry perennial calcareous grassland	41008
E1.2b	Continental dry steppe	5107
E1.3a	Mediterranean closely grazed dry grassland	522
E1.3b	Mediterranean tall perennial dry grassland	1000
E1.3c	Mediterranean annual-rich dry grassland	930
E1.5a	Iberian oromediterranean siliceous dry grassland	676
E1.5b	berian oromediterranean basiphilous dry grassland	902
E1.5c	Cyrno-Sardean-oromediterranean siliceous dry grassland	22
E1.5d	Greek and Anatolian oromediterranean siliceous dry grassland	106
E1.5e	Madeiran oromediterranean siliceous dry grassland	10
E1.7	Lowland to submontane, dry to mesic Nardus grassland	2014
E1.8	Open Iberian supra-mediterranean dry acid and neutral grassland	245
E1.9a	Oceanic to subcontinental inland sand grassland on dry acid and neutral soils	4346
E1.9b	Inland sanddrift and dune with siliceous grassland	2286
E1.A	Mediterranean to Atlantic open, dry, acid and neutral grassland	2066
E1.B	Heavy-metal grassland in Western and Central Europe	133

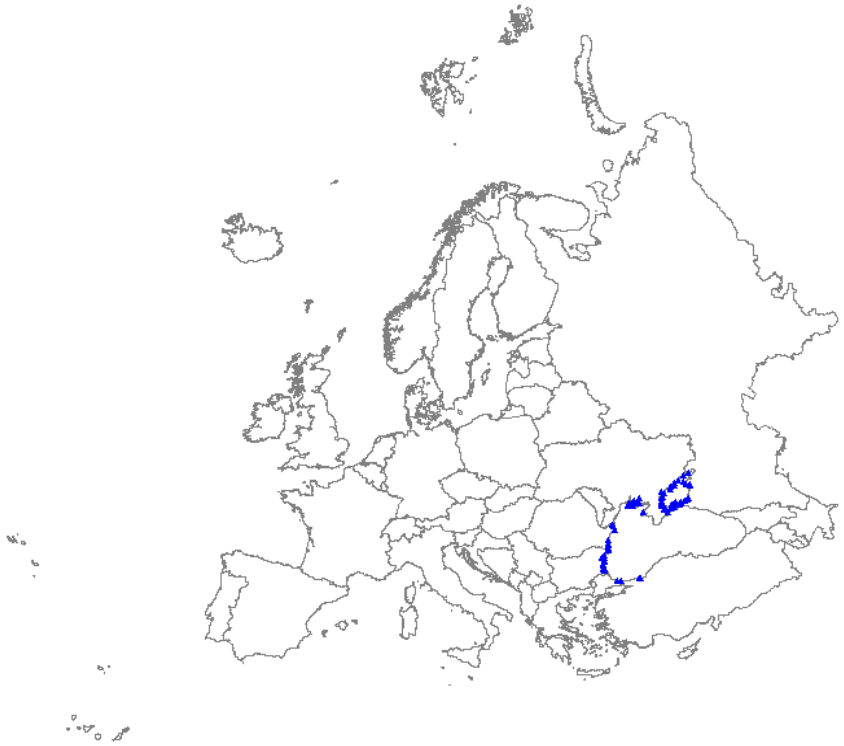
E1.F	Azorean open dry, acid to neutral grassland	4
E2.1	Mesic permanent pasture of lowlands and mountains	30390
E2.2	Low and medium altitude hay meadow	60857
E2.3	Mountain hay meadow	2146
E2.4	Iberian summer pasture (vallicar)	46
E3.1a	Mediterranean tall humid inland grassland	713
E3.2a	Mediterranean short moist grassland of lowlands	144
E3.2b	Mediterranean short moist grassland of mountains	1152
E3.3	Submediterranean moist meadow	1096
E3.4a	Moist or wet mesotrophic to eutrophic hay meadow	22215
E3.4b	Moist or wet mesotrophic to eutrophic pasture	11179
E3.5	Temperate and boreal moist or wet oligotrophic grassland	7401
E4.1	Vegetated snow-patch	1339
E4.3a	Boreal and arctic acidophilous alpine grassland	18
E4.3b	Temperate acidophilous alpine grassland	8422
E4.4a	Arctic-alpine calcareous grassland	3329
E4.4b	Alpine and subalpine calcareous grassland of the Balkan and Apennines	531
E5.2a	Thermophilous woodland fringe of base-rich soils	845
E5.2b	Thermophilous woodland fringe of acidic soils	134
E5.2c	Macaronesian thermophilous woodland fringe	10
E5.4	Lowland moist or wet tall-herb and fern fringe	11159
E5.5	Subalpine moist or wet tall-herb and fern fringe	788
E6.1	Mediterranean inland salt steppe	640
E6.2	Continental inland salt steppe	1242
E6.3	Temperate inland salt marsh	982

B1.4a - Atlantic and Baltic coastal dune grassland (grey dune)

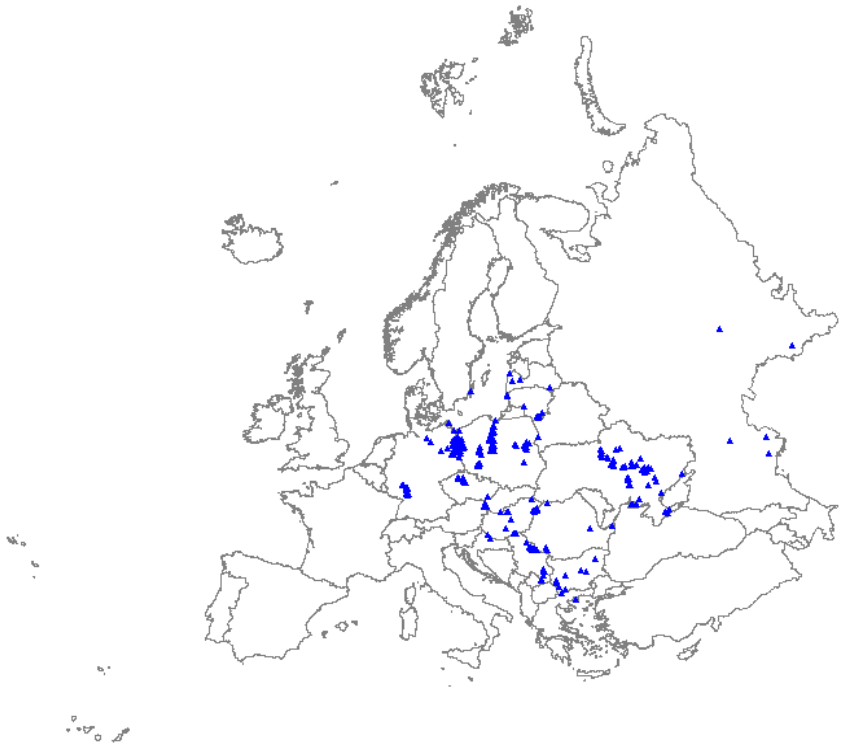


B1.4b - Mediterranean and Macaronesian coastal dune grassland (grey dune)

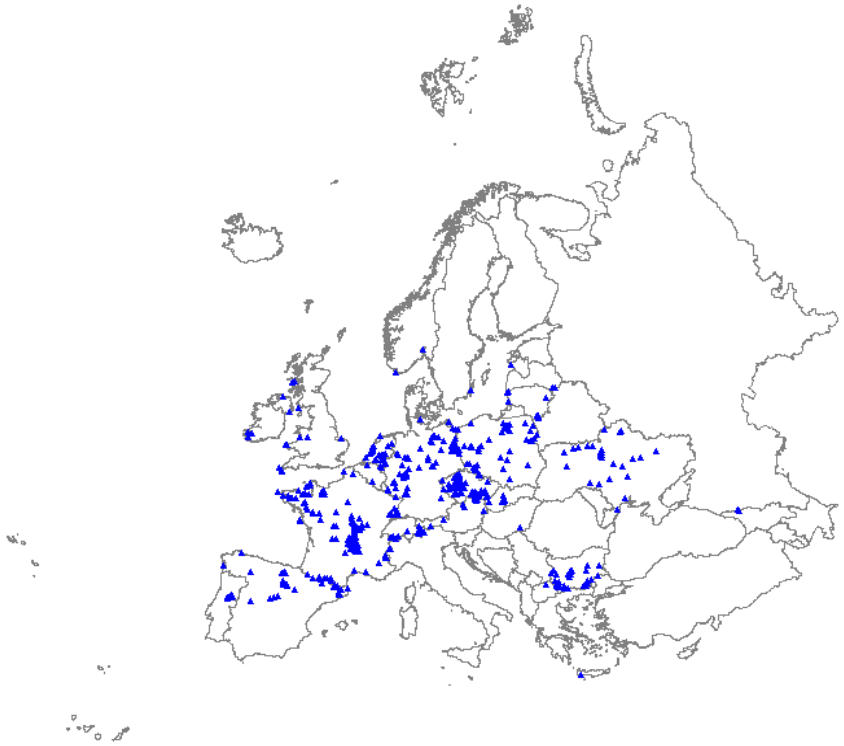
B1.4c - Black Sea coastal dune grassland (grey dune)



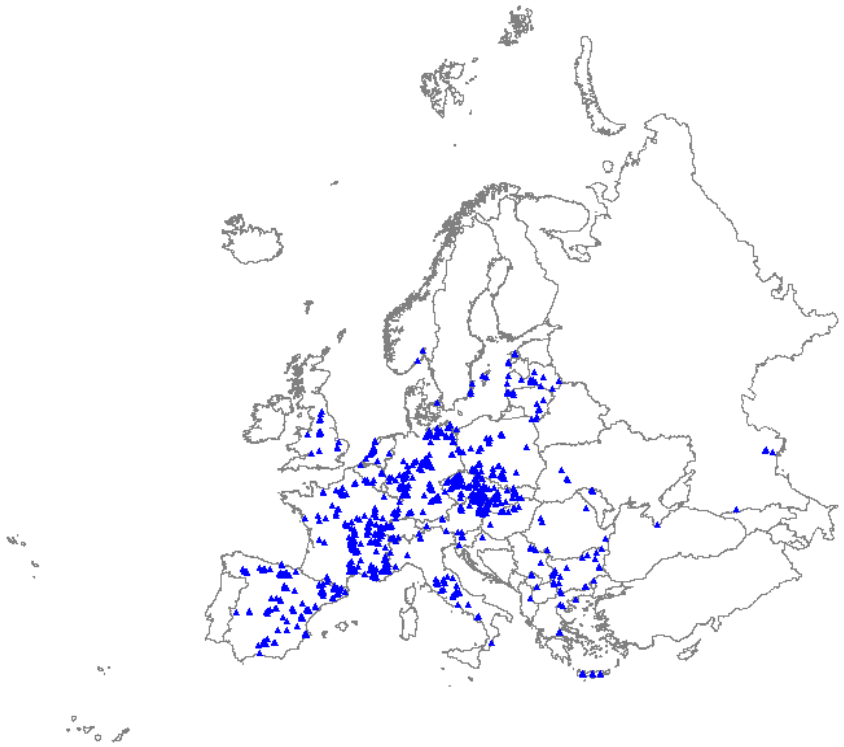
E1.1a - Pannonian and Pontic sandy steppe



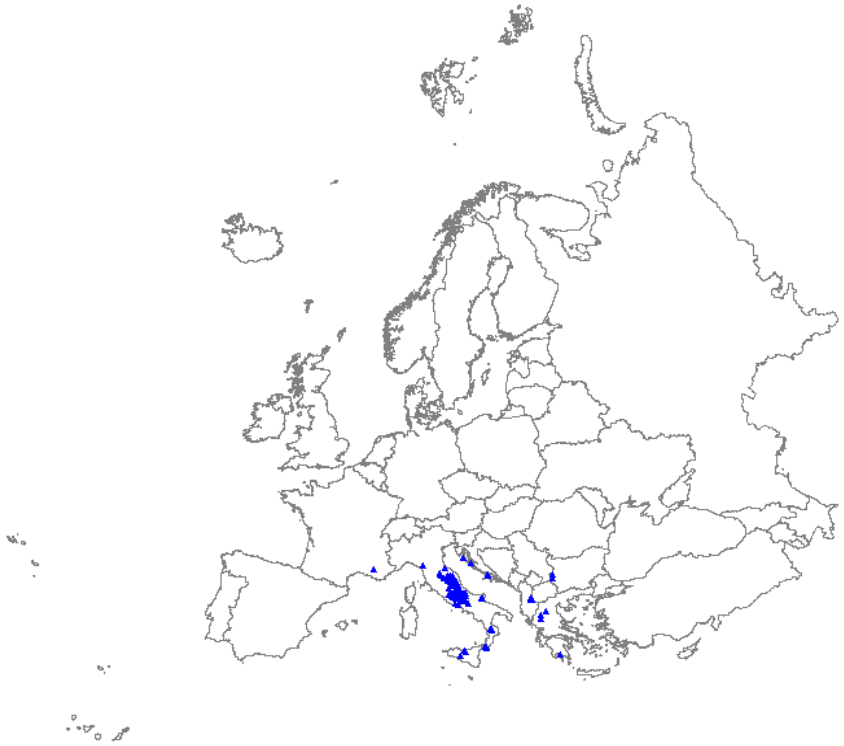
E1.1b - Cryptogam- and annual-dominated vegetation on siliceous rock outcrops



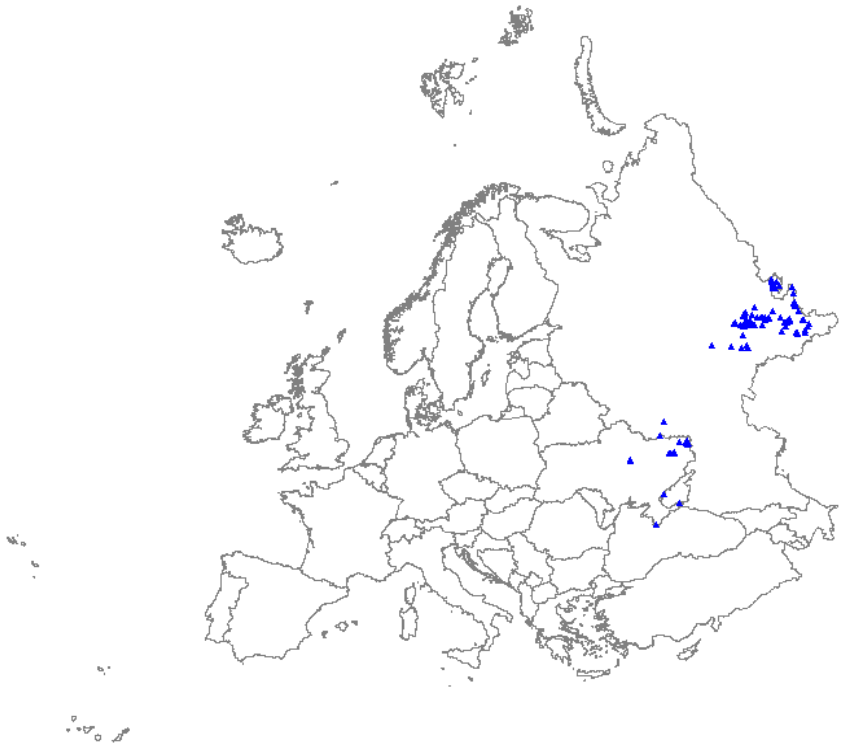
E1.1d - Cryptogam- and annual-dominated vegetation on calcareous and ultramafic rock outcrops



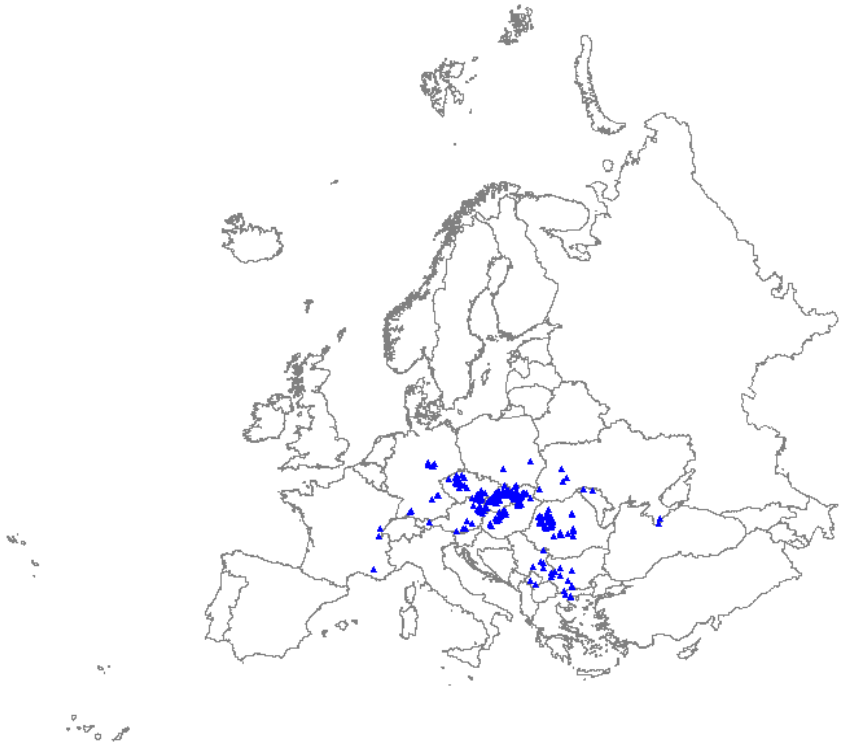
E1.1e - Perennial rocky grassland of the Italian Peninsula



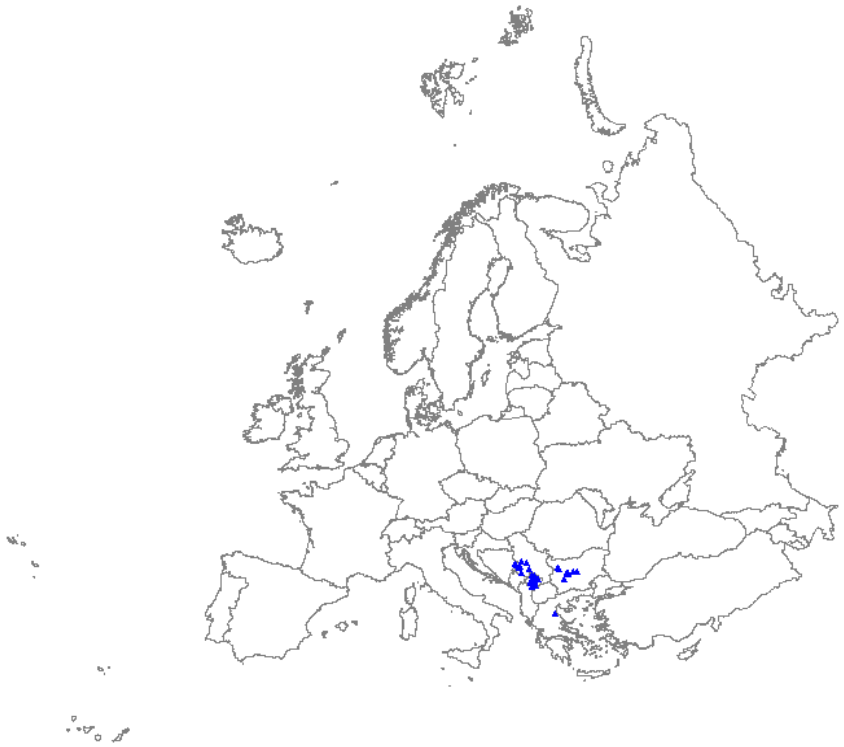
E1.1f - Continental dry rocky steppic grassland and dwarf scrub on chalk outcrops



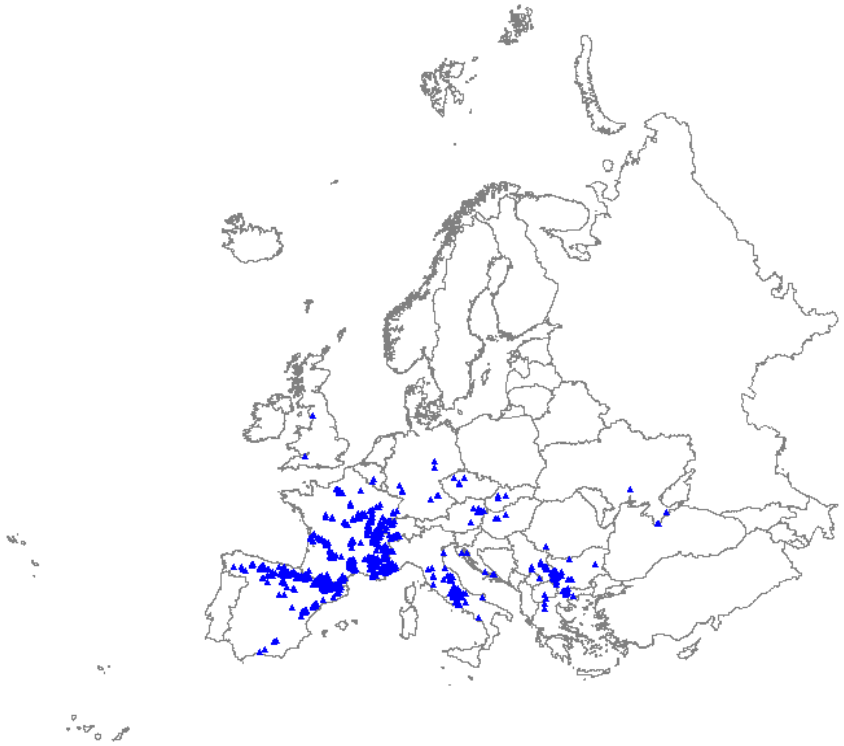
E1.1g - Perennial rocky grassland of Central Europe and the Carpathians



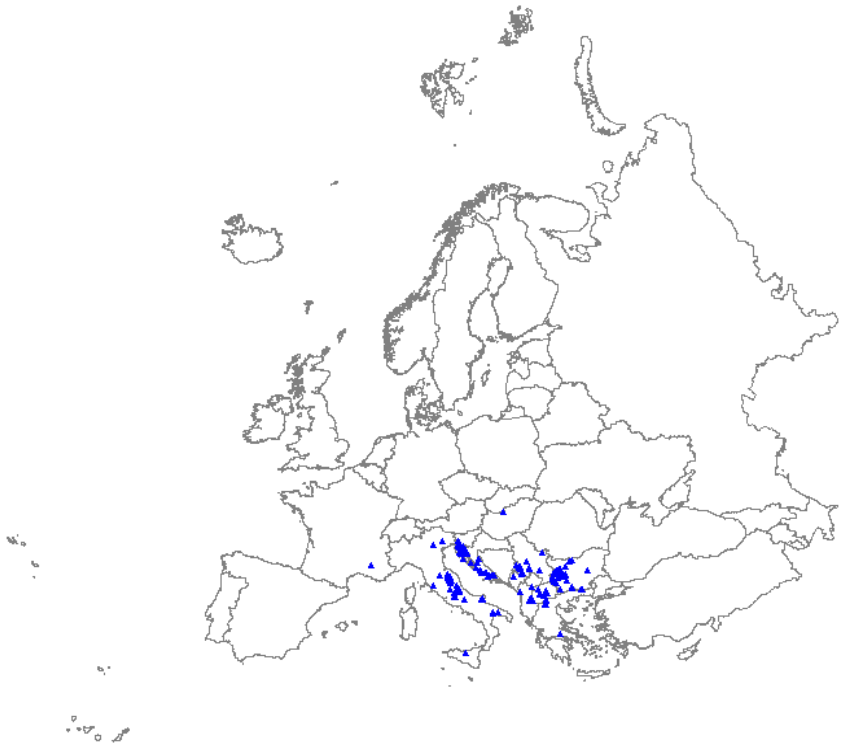
E1.1h - Heavy-metal dry grassland of the Balkans



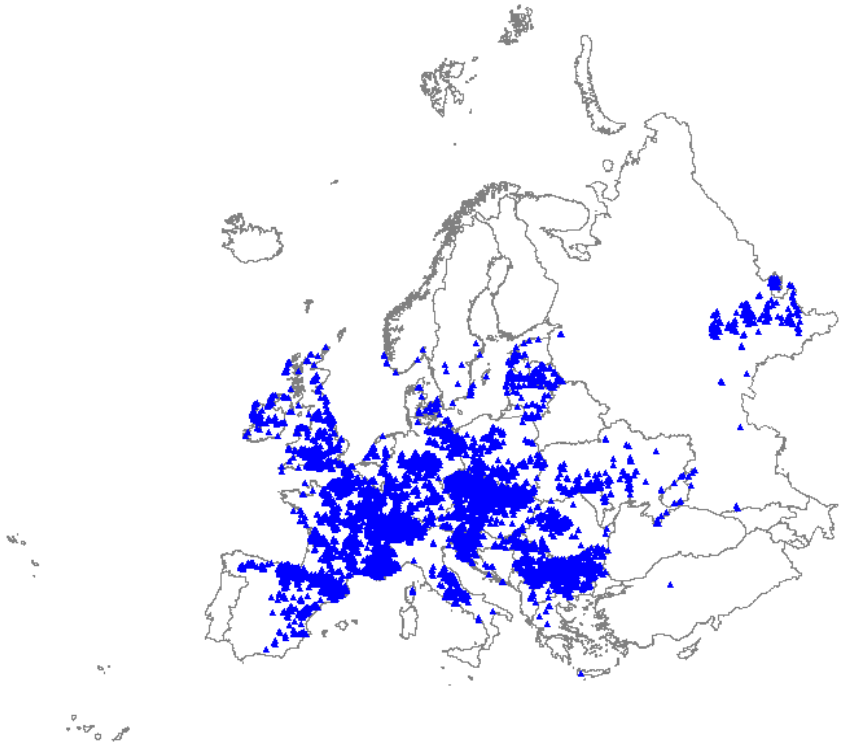
E1.1i - Perennial rocky calcareous grassland of subatlantic-submediterranean Europe



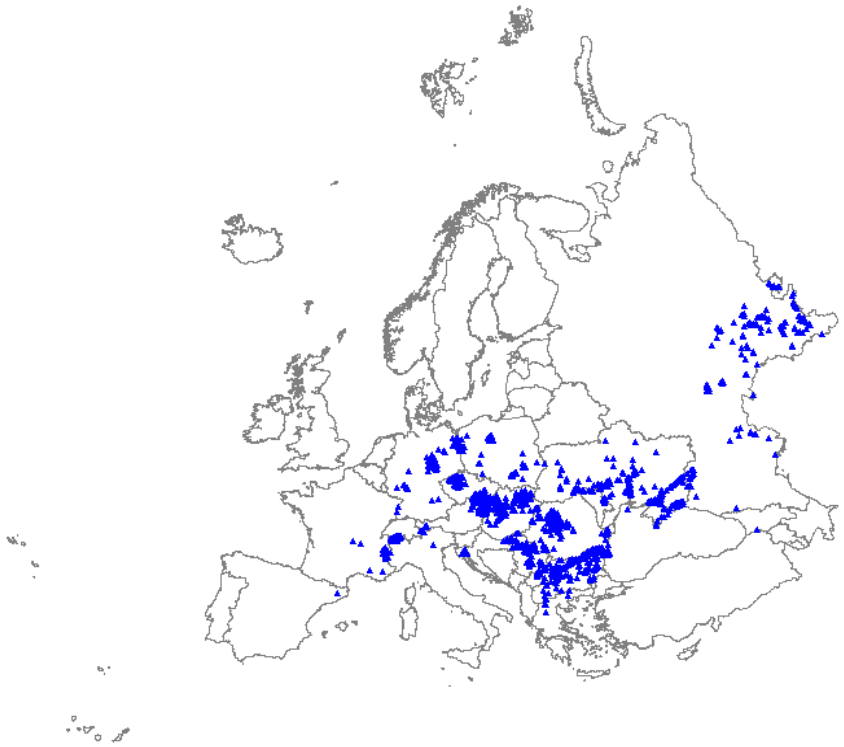
E1.1j - Dry steppic, submediterranean pasture of South-Eastern Europe



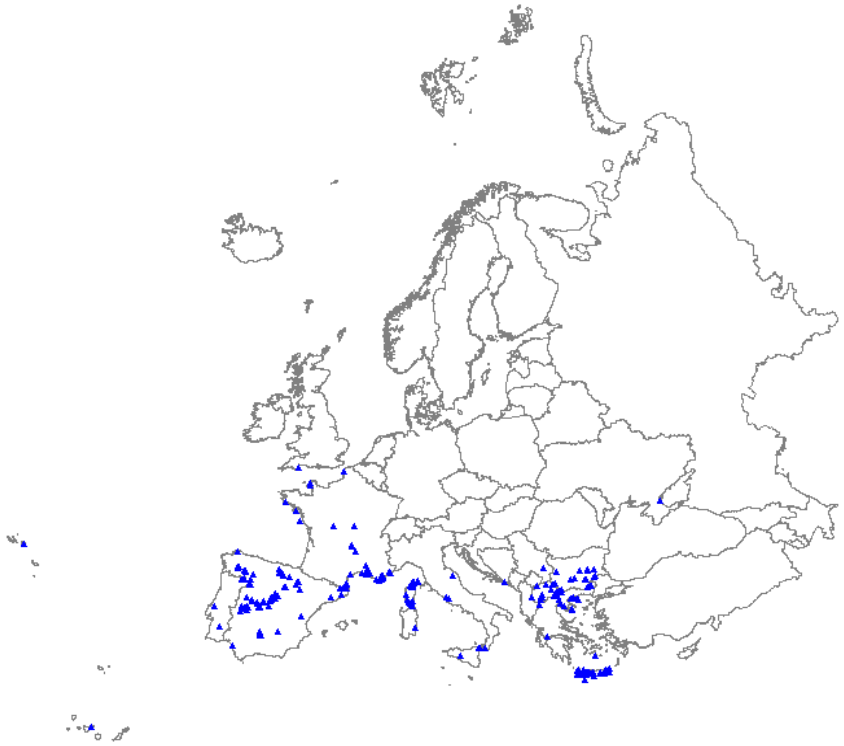
E1.2a - Semi-dry perennial calcareous grassland



E1.2b - Continental dry steppe

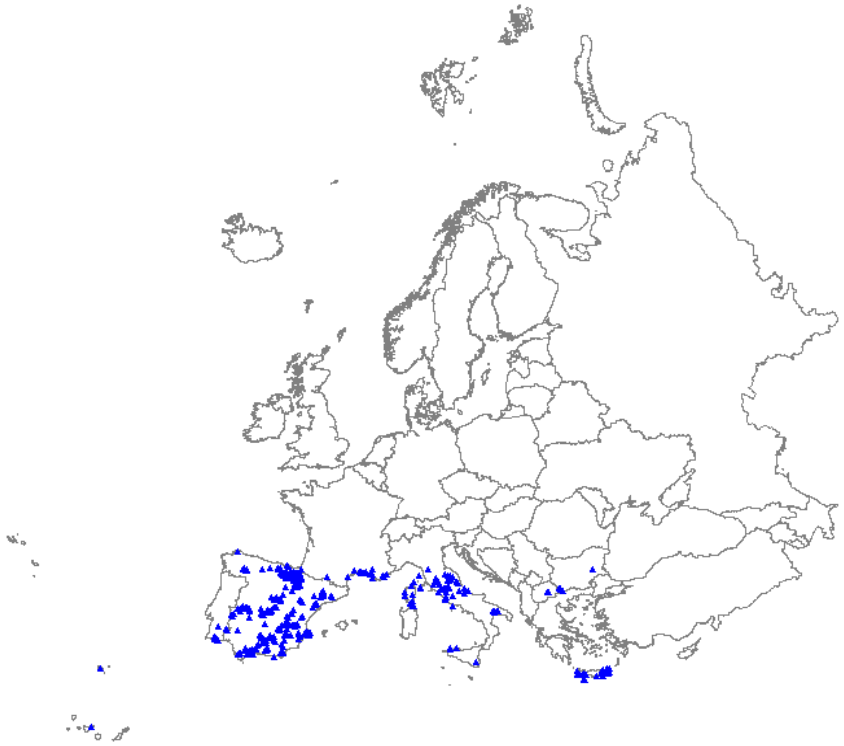


E1.3a - Mediterranean closely grazed dry grassland

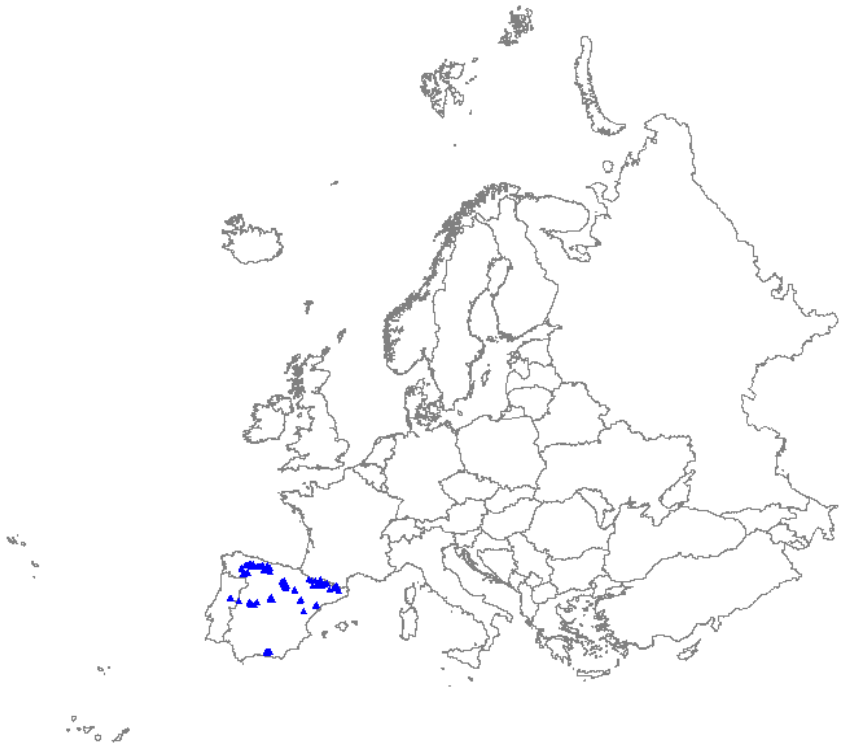


E1.3b - Mediterranean tall perennial dry grassland

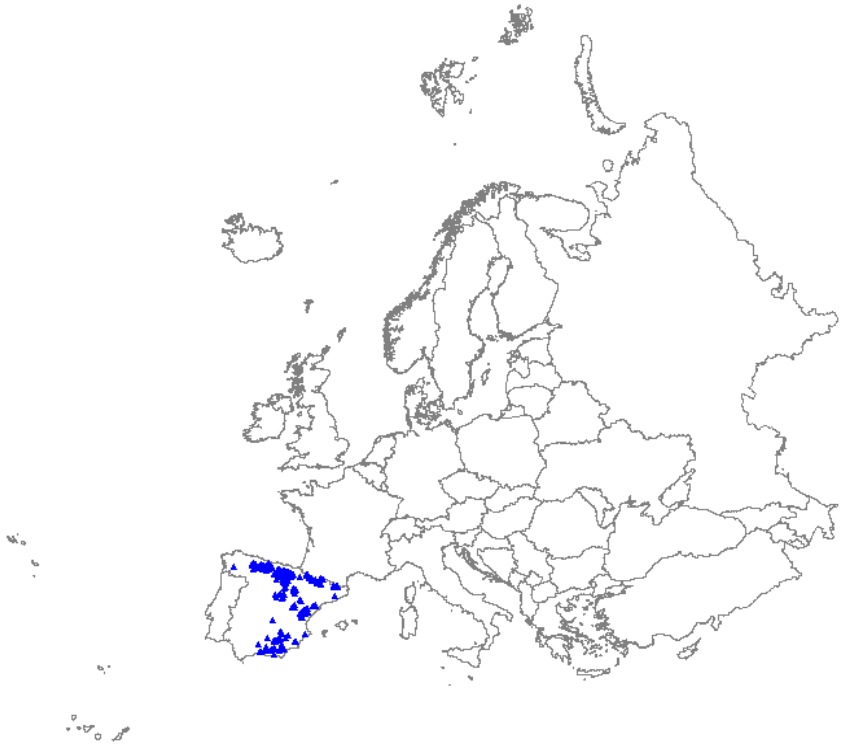
E1.3c - Mediterranean annual-rich dry grassland



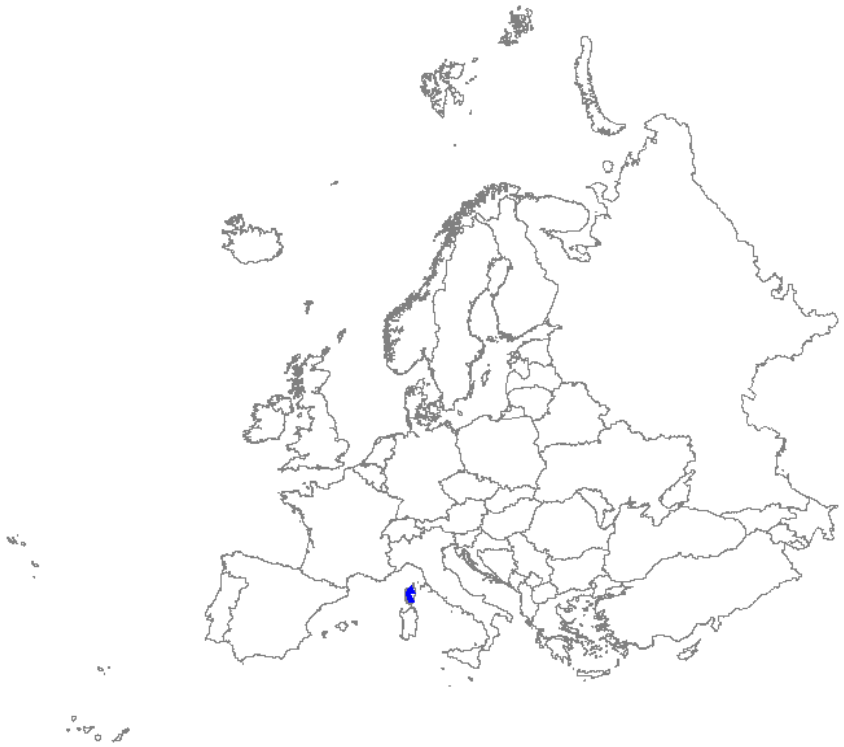
E1.5a - Iberian oromediterranean siliceous dry grassland



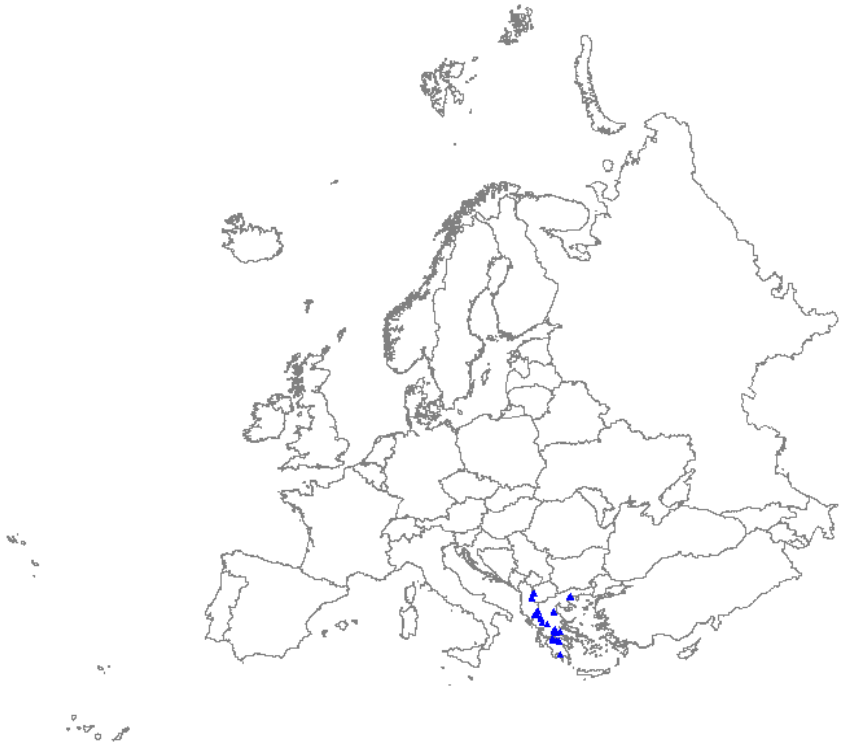
E1.5b - Iberian oromediterranean basiphilous dry grassland



E1.5c - Cyrno-Sardean-oromediterranean siliceous dry grassland

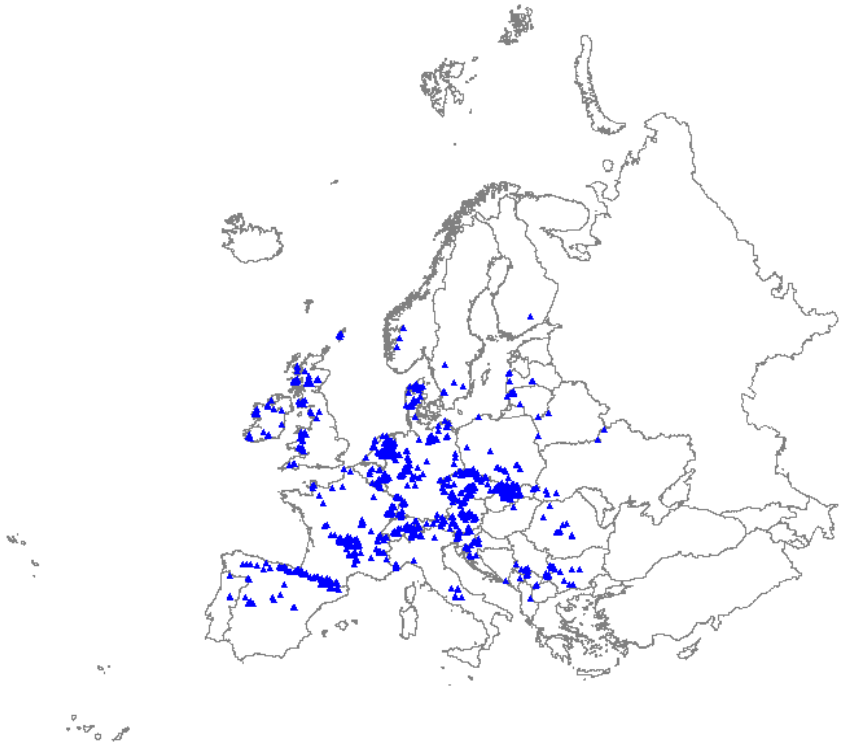


E1.5d - Greek and Anatolian oromediterranean siliceous dry grassland

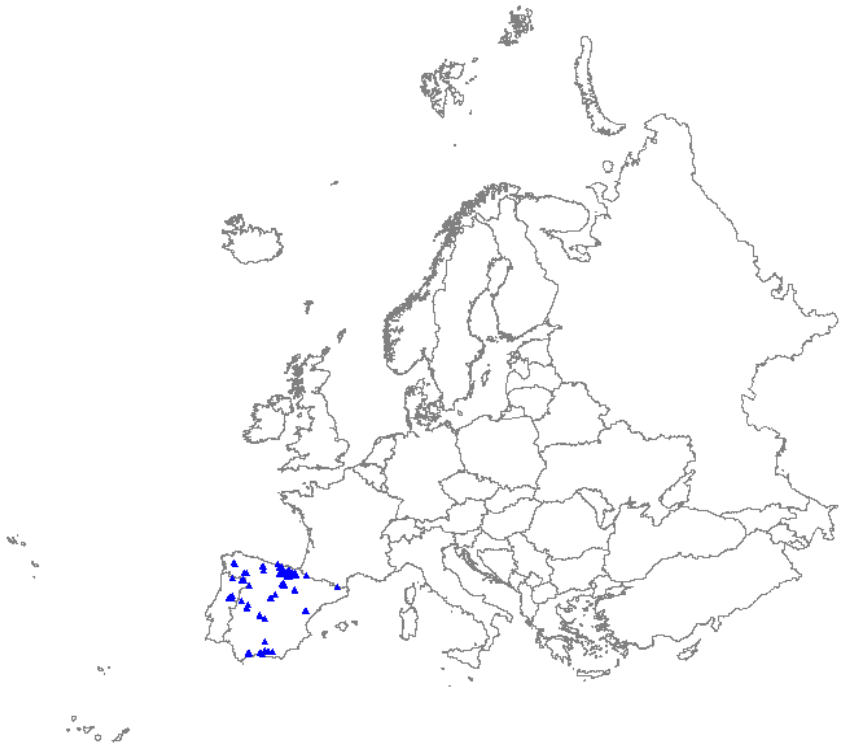


E1.5e - Madeiran oromediterranean siliceous dry grassland

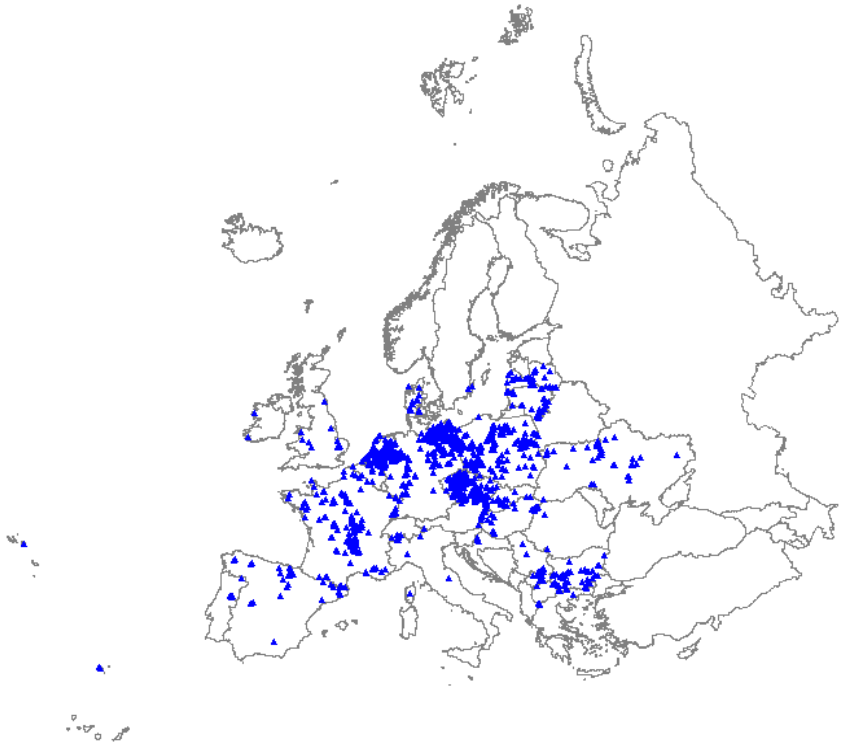
E1.7 - Lowland to submontane, dry to mesic Nardus grassland



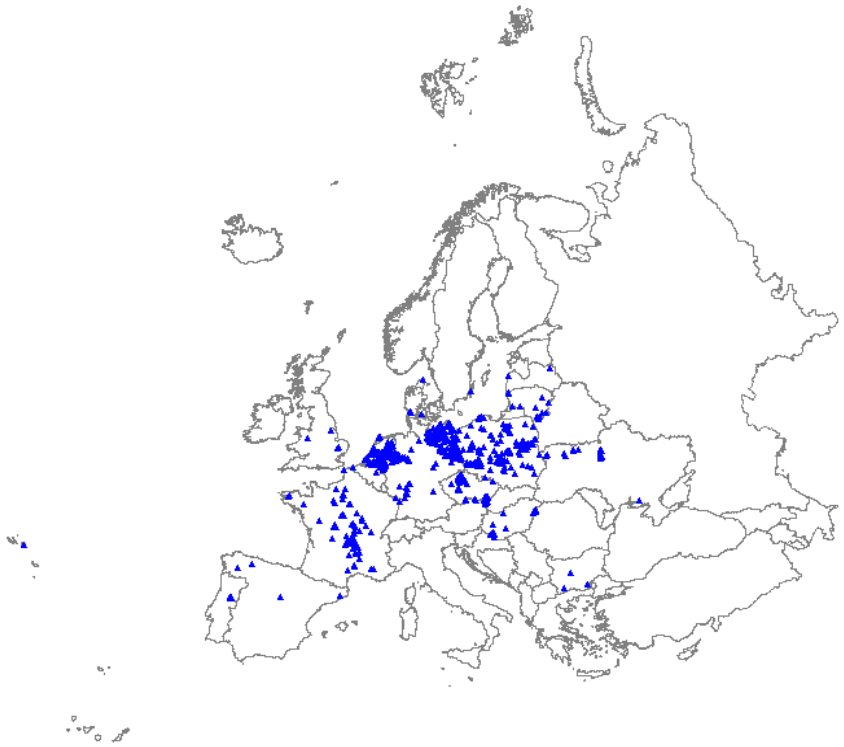
E1.8 - Open Iberian supra-mediterranean dry acid and neutral grassland



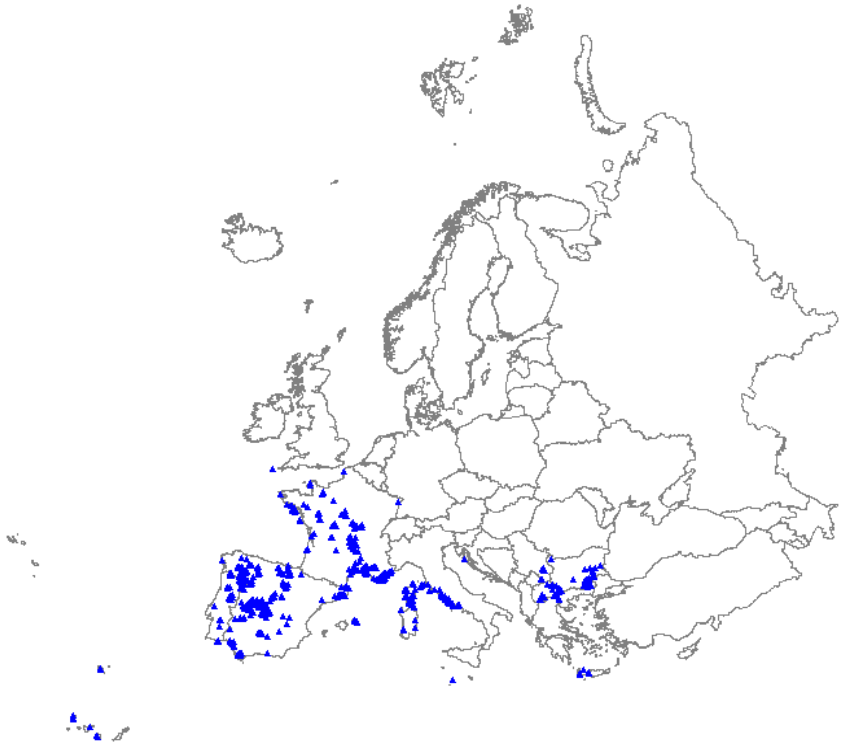
E1.9a - Oceanic to subcontinental inland sand grassland on dry acid and neutral soils



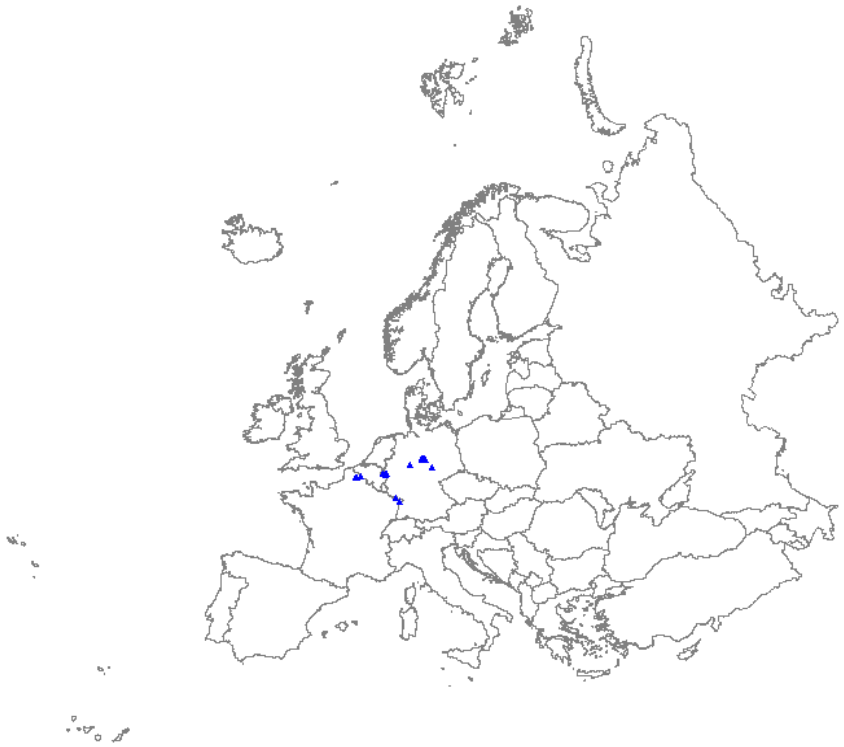
E1.9b - Inland sanddrift and dune with siliceous grassland



E1.A - Mediterranean to Atlantic open, dry, acid and neutral grassland

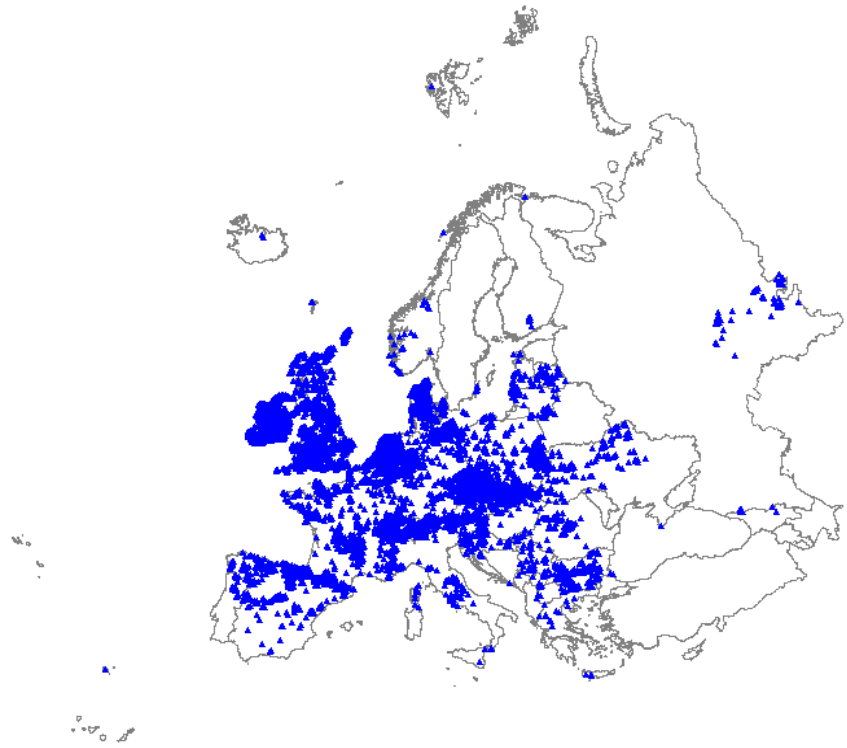


E1.B - Heavy-metal grassland in Western and Central Europe

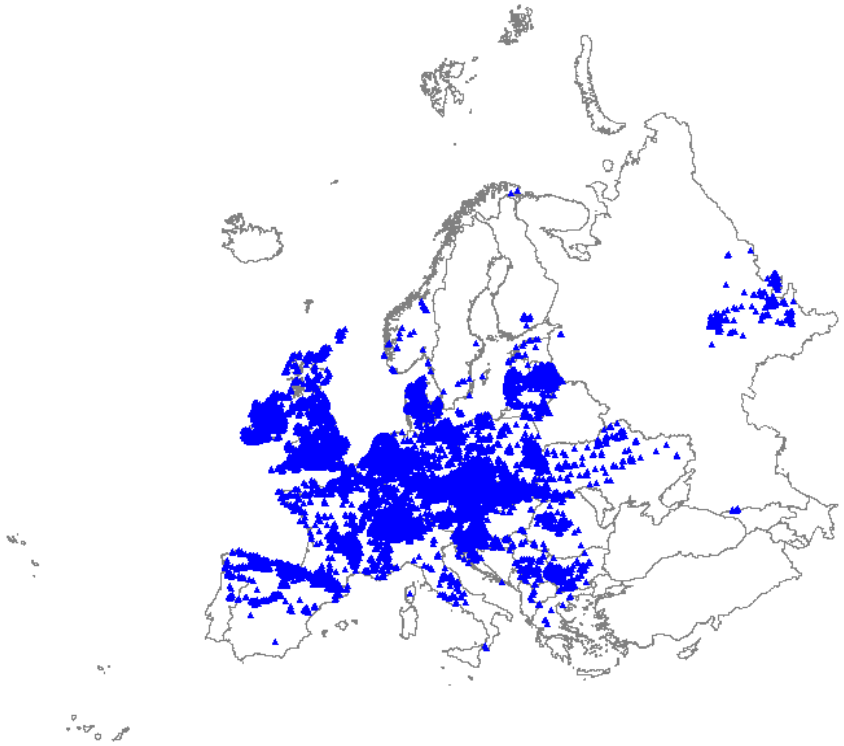


E1.F - Azorean open dry, acid to neutral grassland

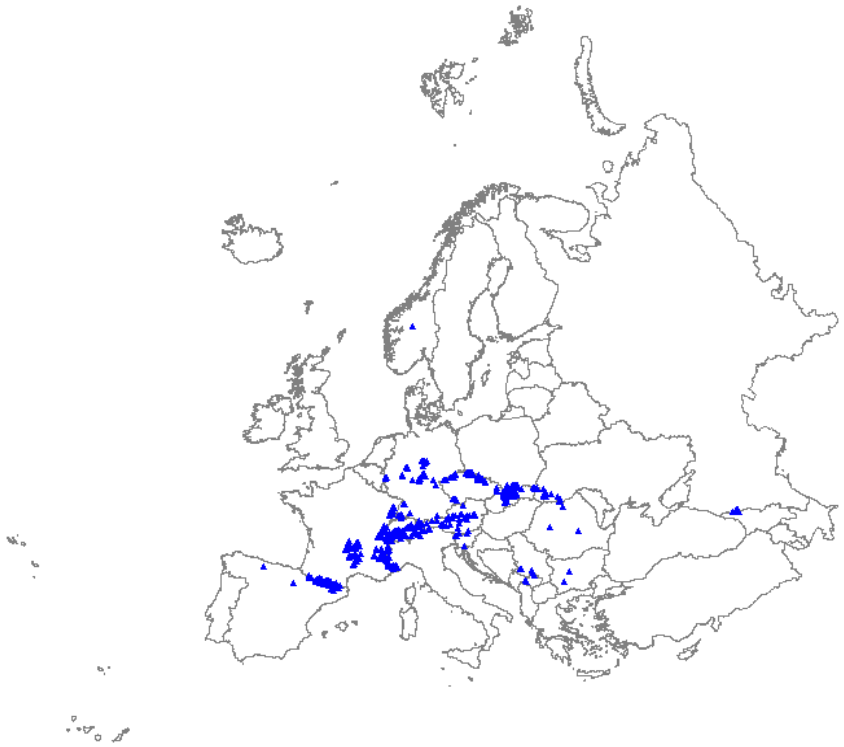
E2.1 - Mesic permanent pasture of lowlands and mountains



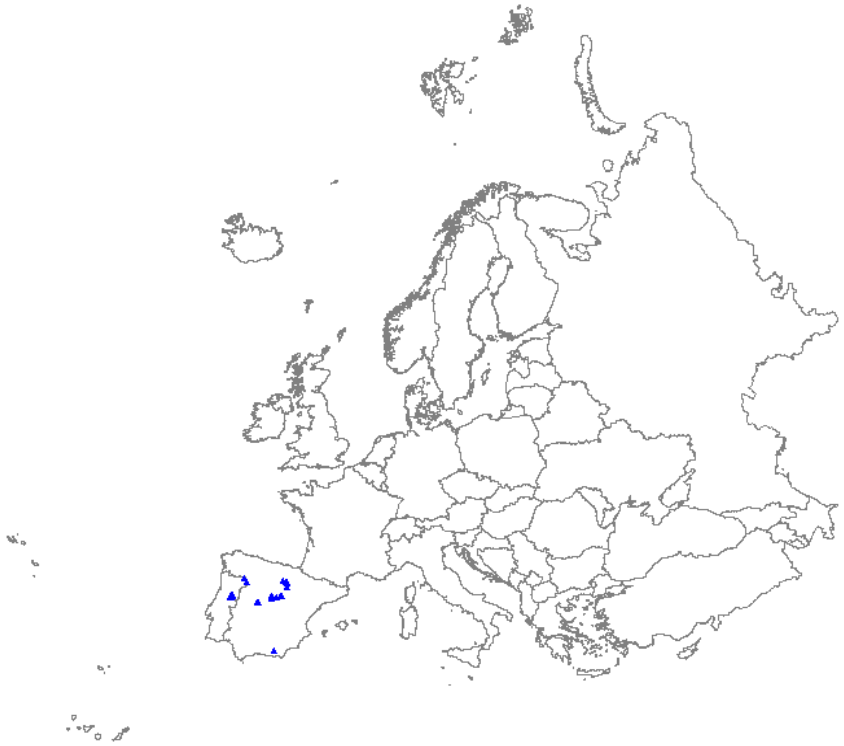
E2.2 - Low and medium altitude hay meadow



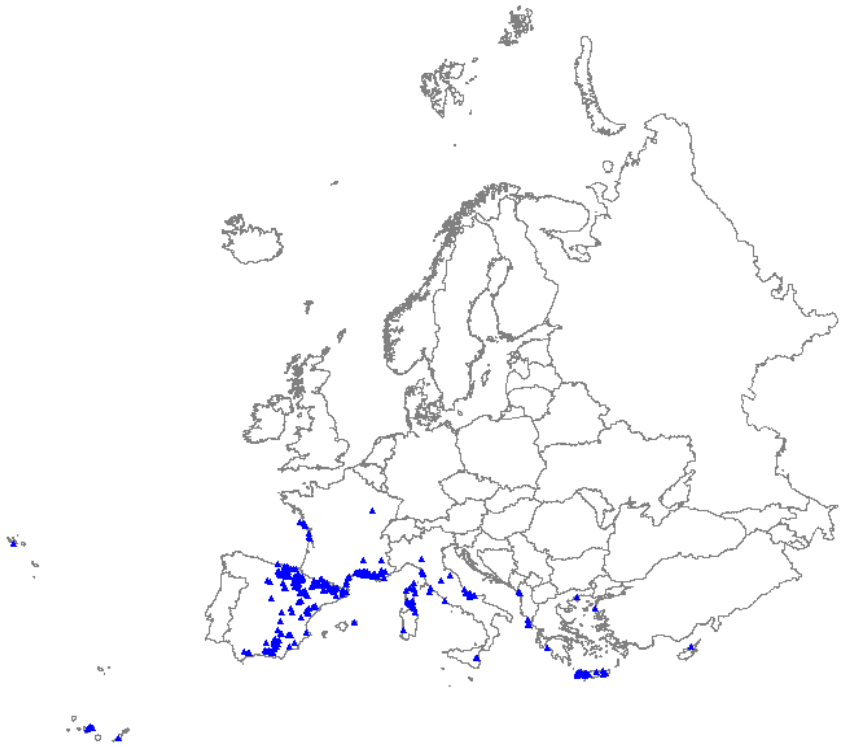
E2.3 - Mountain hay meadow



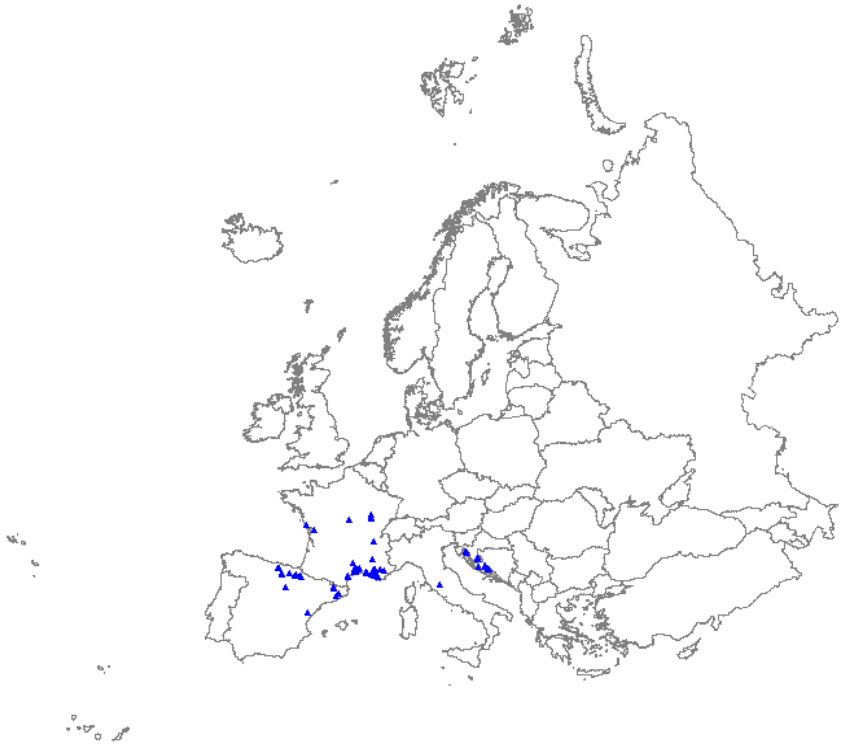
E2.4 - Iberian summer pasture (vallicar)



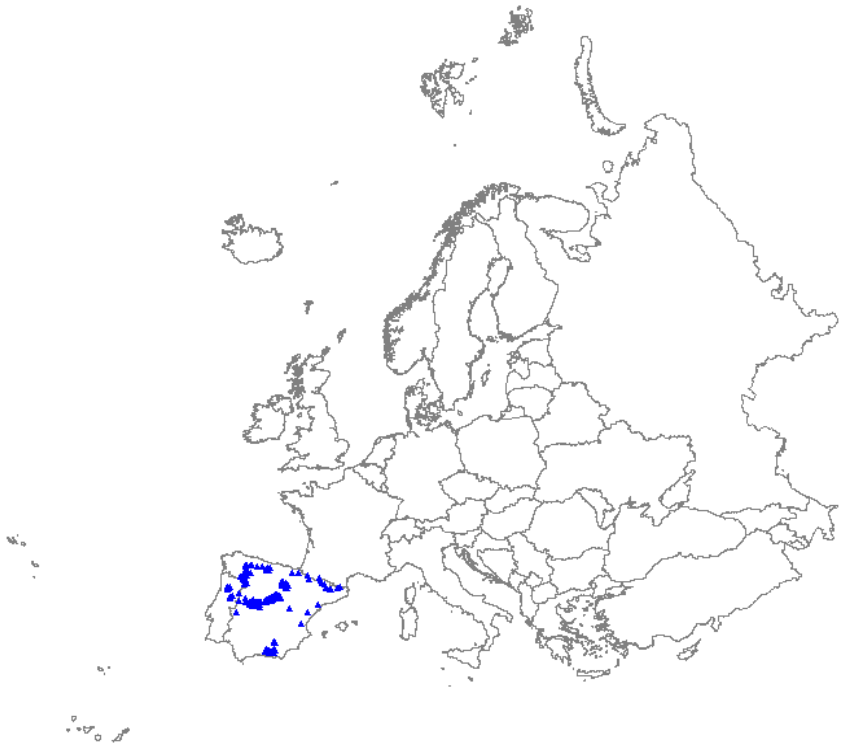
E3.1a - Mediterranean tall humid inland grassland



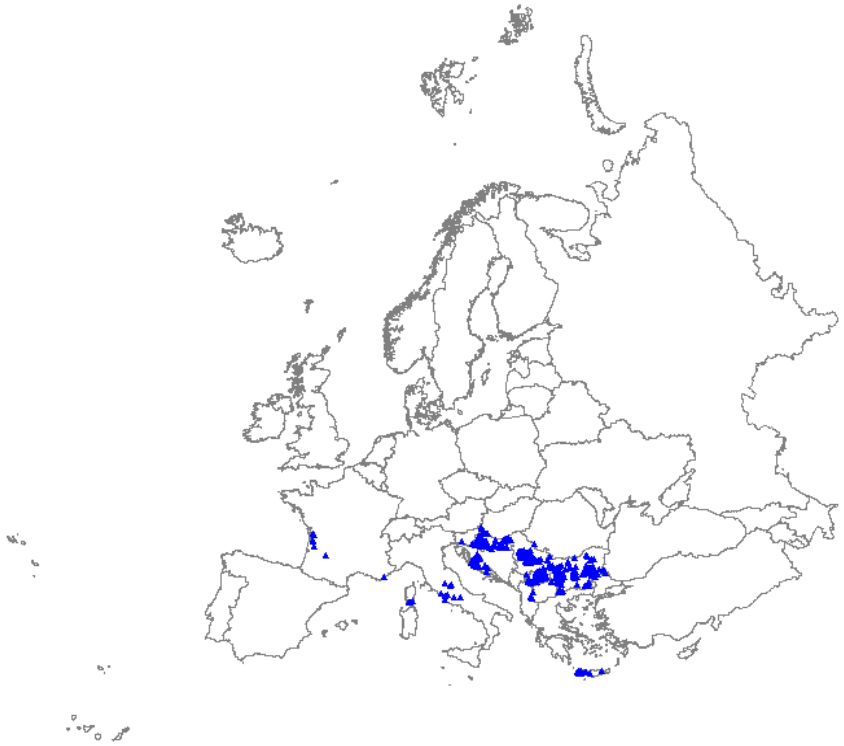
E3.2a - Mediterranean short moist grassland of lowlands



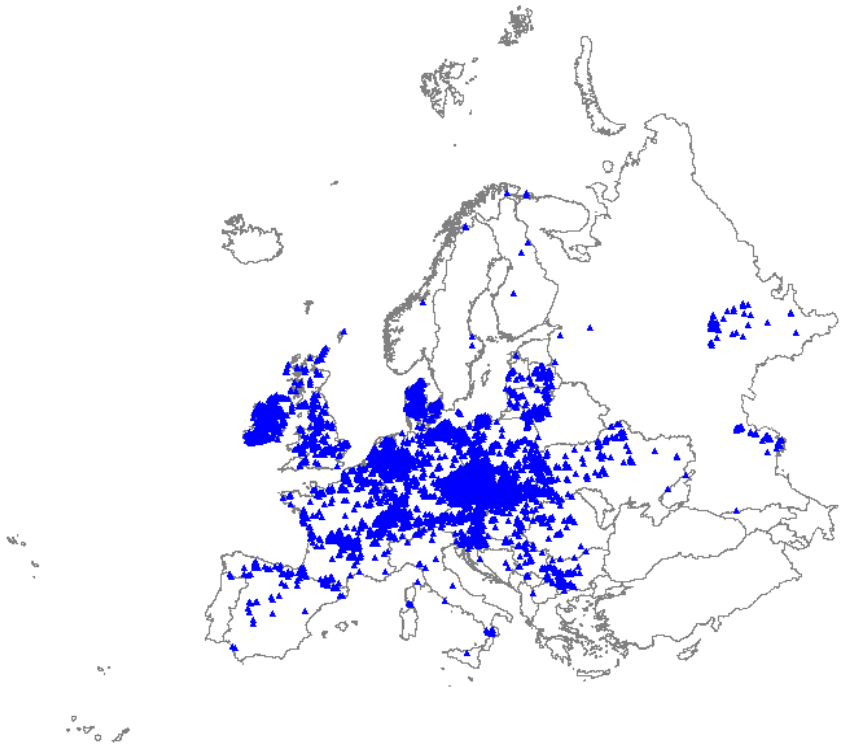
E3.2b - Mediterranean short moist grassland of mountains



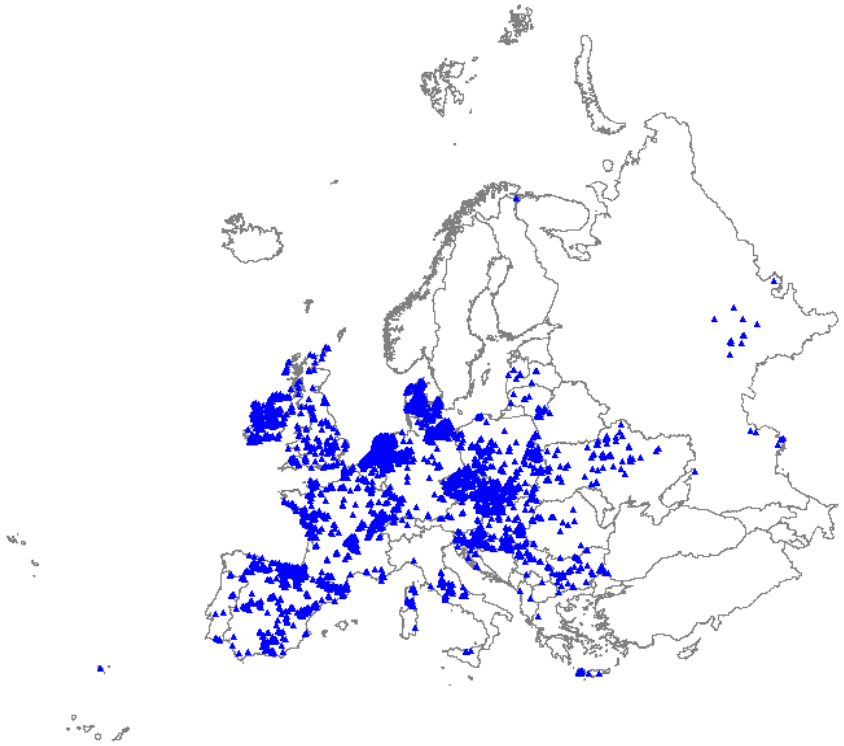
E3.3 - Submediterranean moist meadow



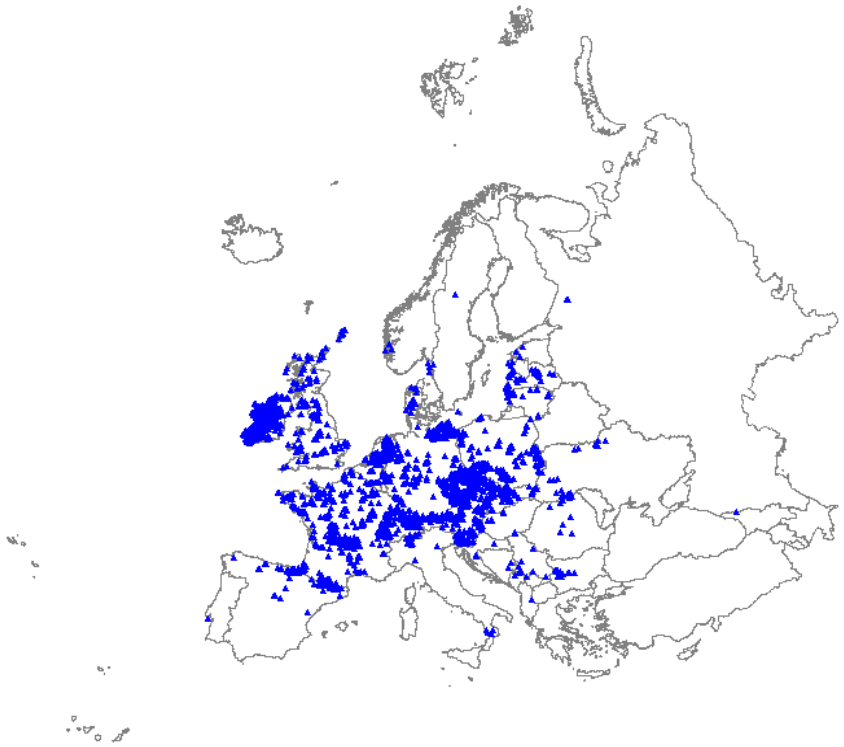
E3.4a - Moist or wet mesotrophic to eutrophic hay meadow



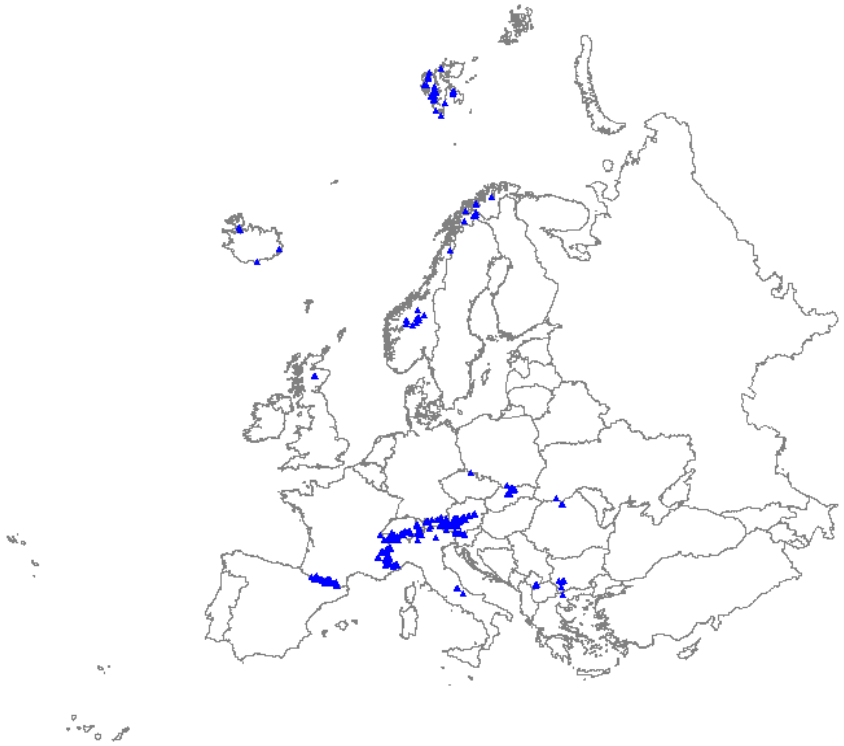
E3.4b - Moist or wet mesotrophic to eutrophic pasture



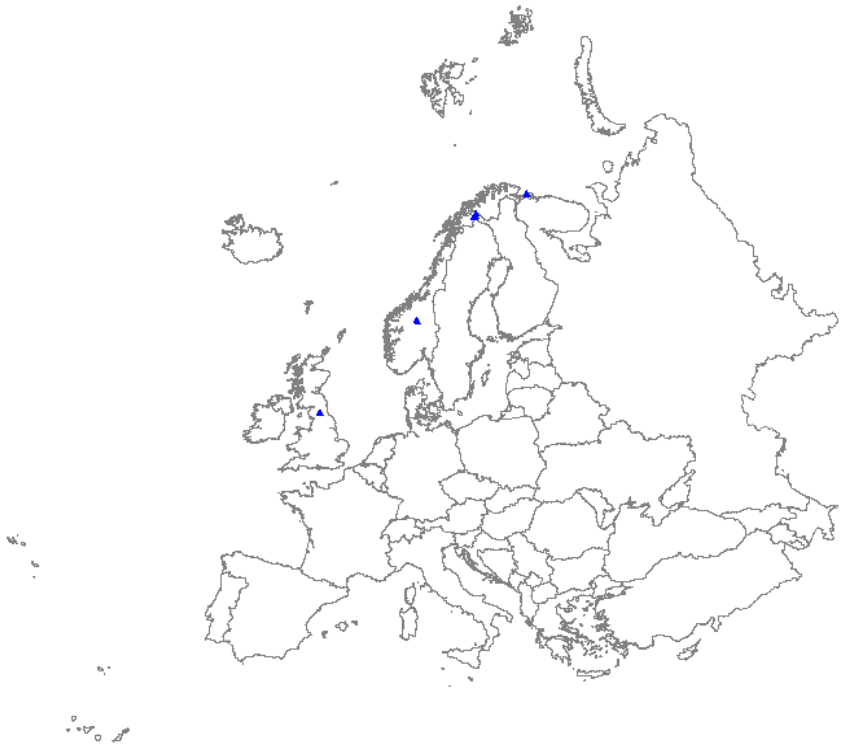
E3.5 - Temperate and boreal moist or wet oligotrophic grassland



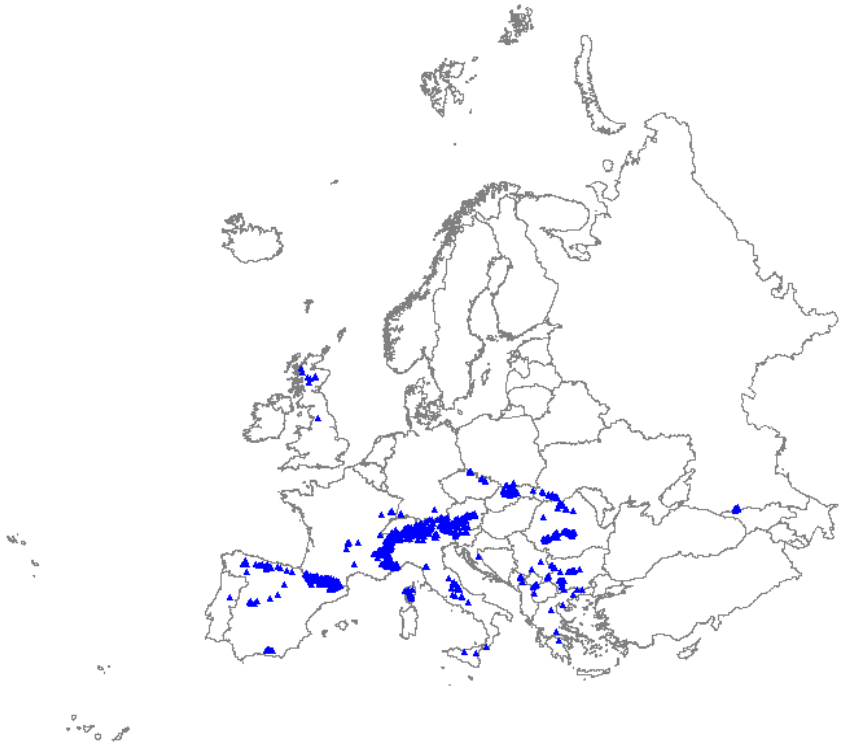
E4.1 - Vegetated snow-patch



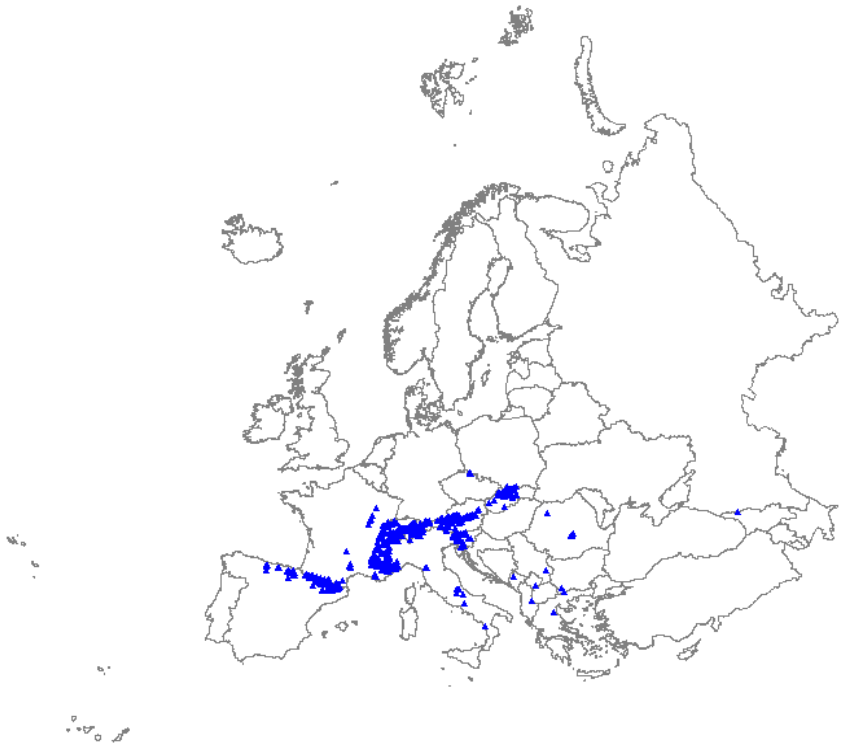
E4.3a - Boreal and arctic acidophilous alpine grassland



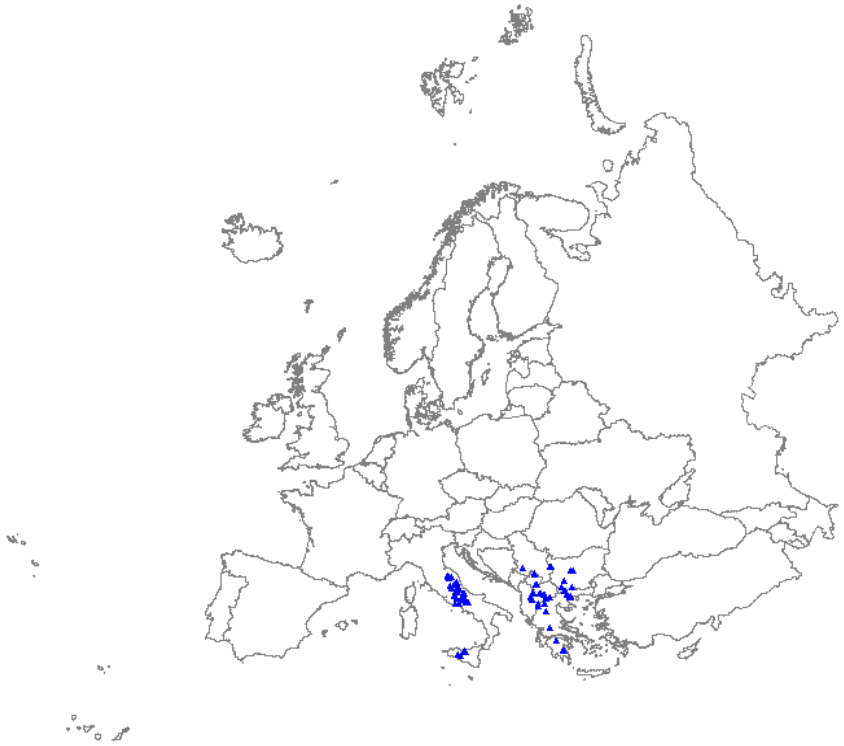
E4.3b - Temperate acidophilous alpine grassland



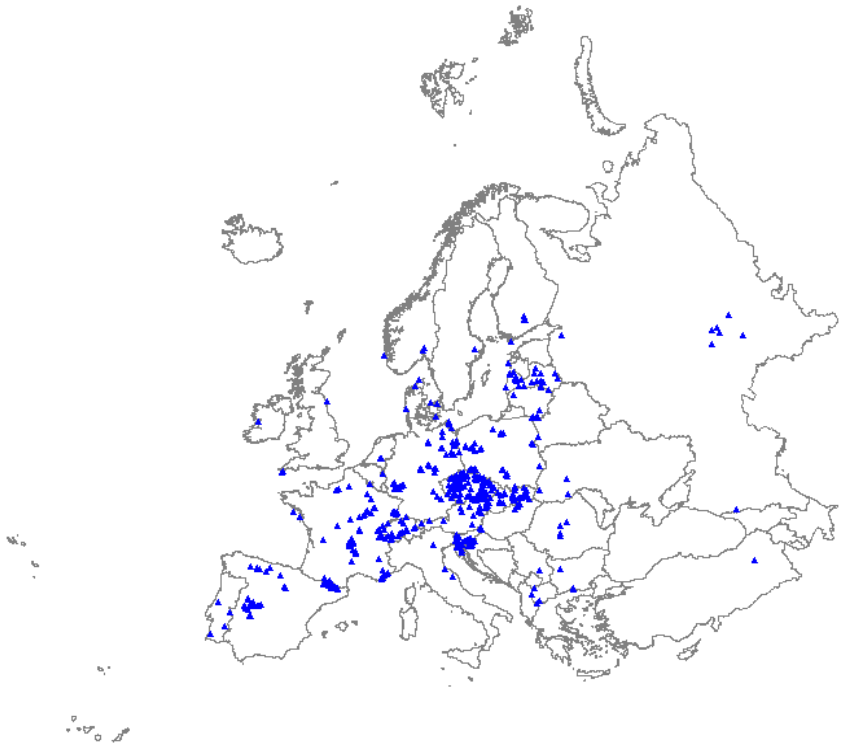
E4.4a - Arctic-alpine calcareous grassland



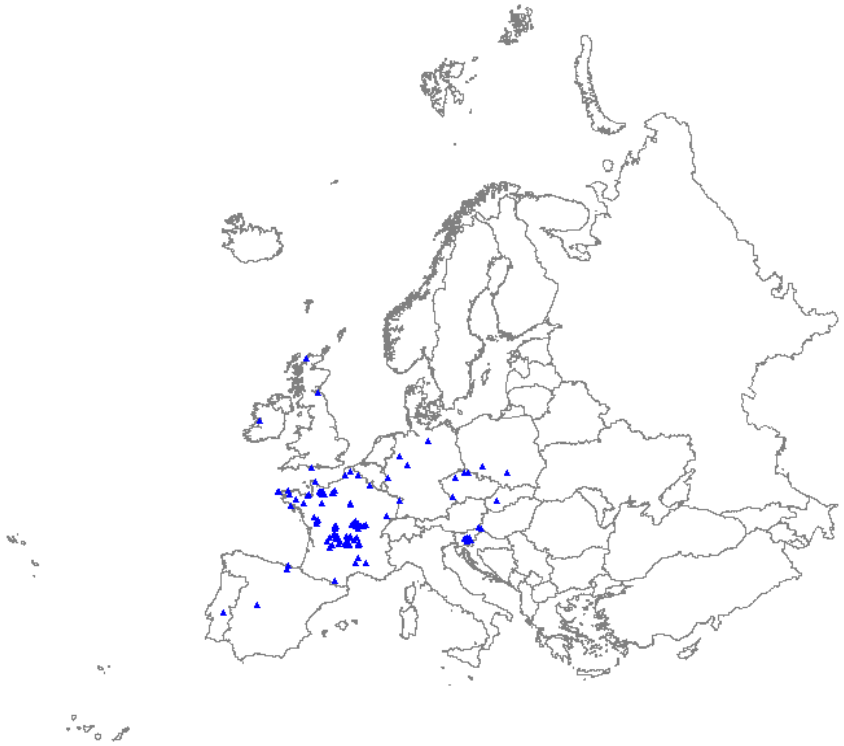
E4.4b - Alpine and subalpine calcareous grassland of the Balkan and Apennines



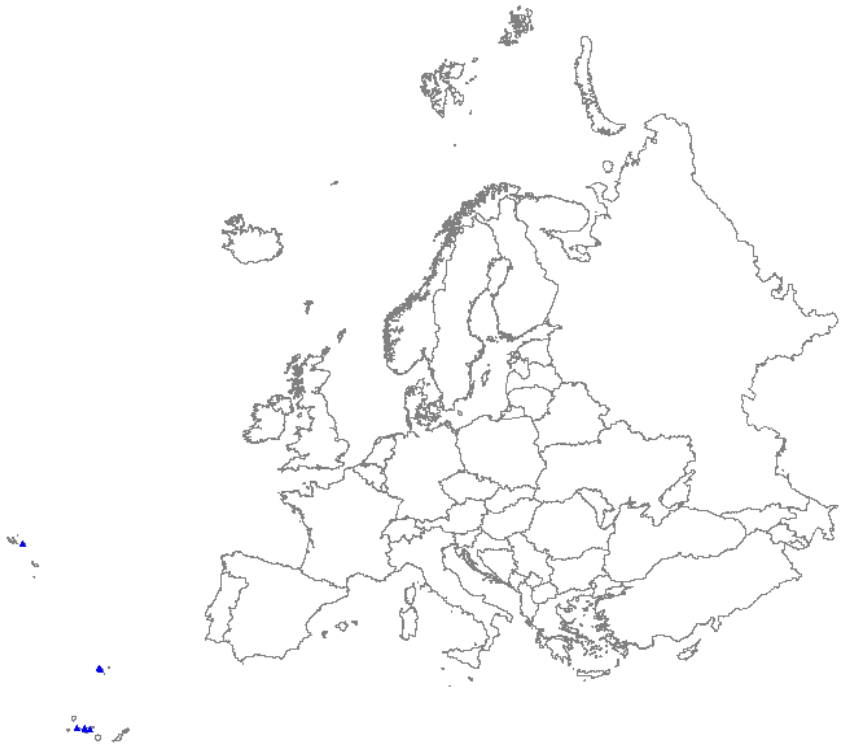
E5.2a - Thermophilous woodland fringe of base-rich soils



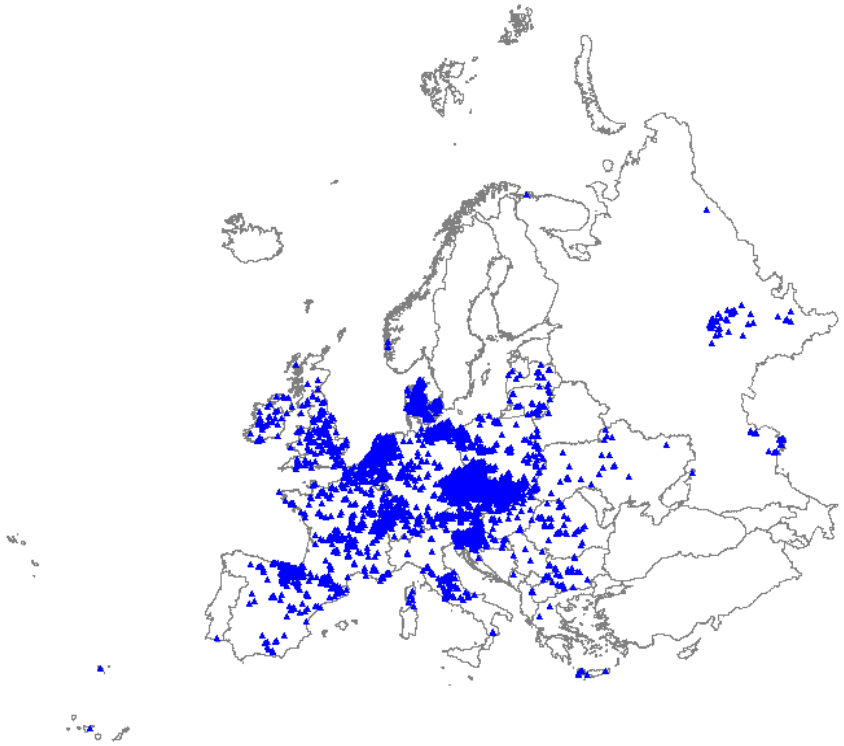
E5.2b - Thermophilous woodland fringe of acidic soils



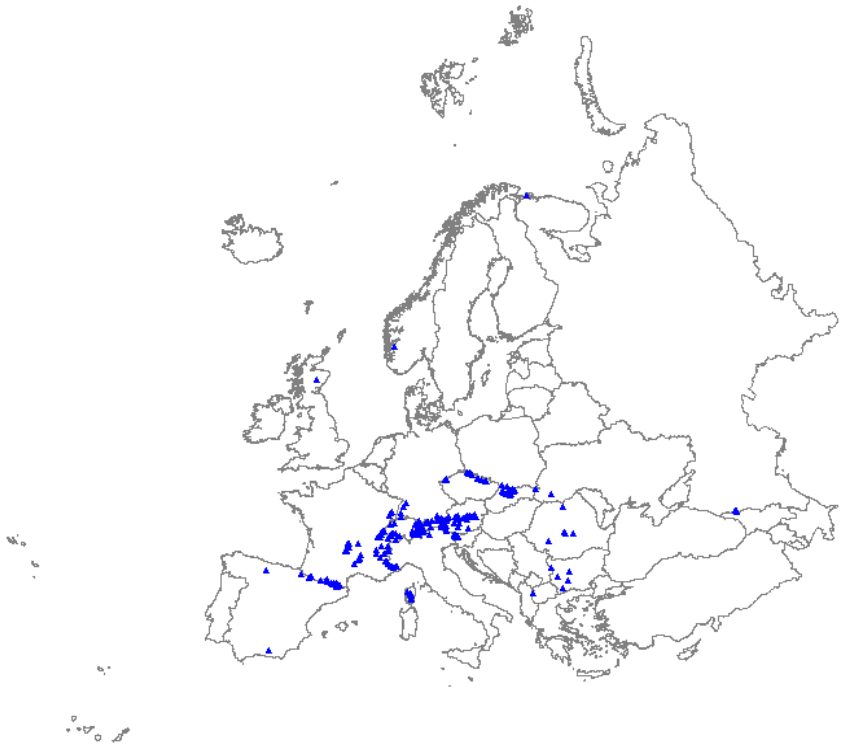
E5.2c - Macaronesian thermophilous woodland fringe



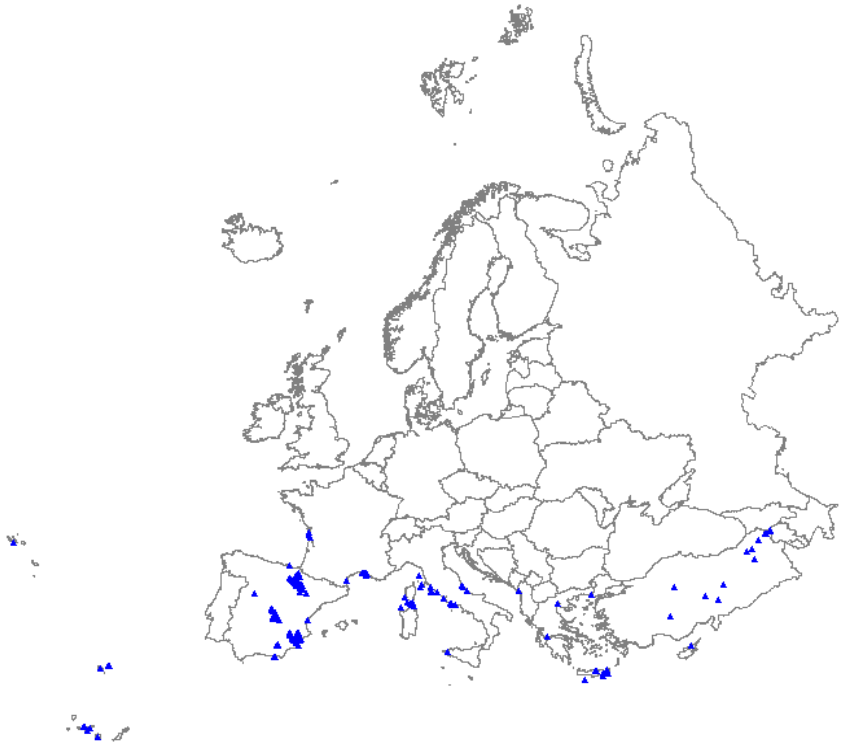
E5.4 - Lowland moist or wet tall-herb and fern fringe



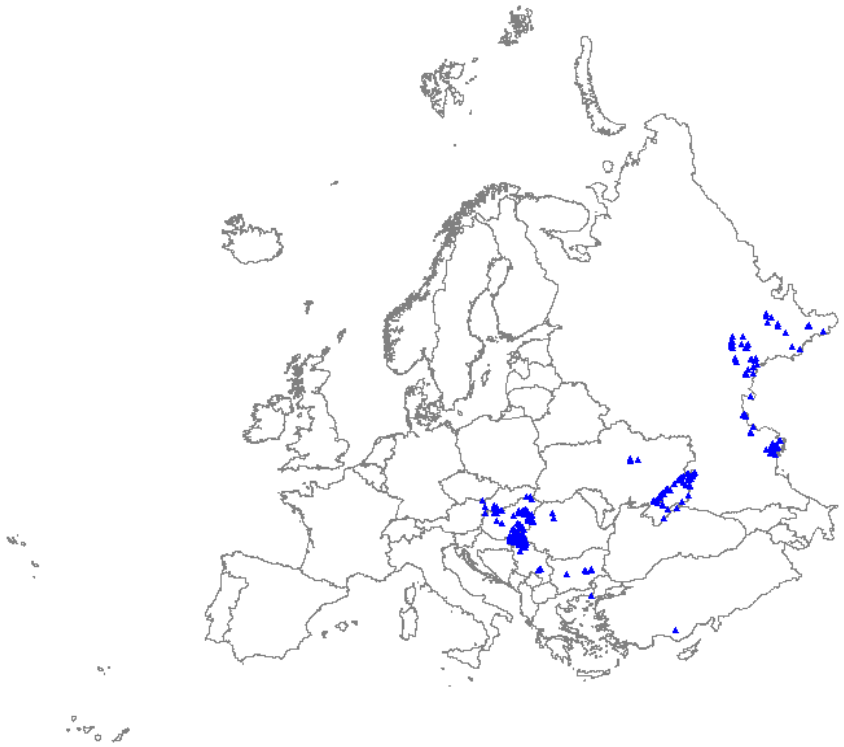
E5.5 - Subalpine moist or wet tall-herb and fern fringe



E6.1 - Mediterranean inland salt steppe



E6.2 - Continental inland salt steppe



E6.3 - Temperate inland salt marsh
